## Introduction

---

Welcome to the PowerTrans PT-7828, a managed redundant Gigabit Ethernet switch designed especially for connecting Ethernet-enabled devices for industrial field applications.

The following topics are covered in this chapter:

- ☐ **Overview**
- ☐ **Package Checklist**
- ☐ **Software Features**

## Overview

The PowerTrans PT-7828 is certified for use in power substation automation systems (IEC 61850-3, IEEE 1613), traffic control systems (NEMA TS 2), and railway applications (EN50121-4). It can be used for Gigabit or Fast Ethernet backbones and supports redundant ring topologies. It also supports dual power inputs (24/48 VDC or 110/220 VDC/VAC) to increase the reliability of communication.

The PT-7828 has a modular design that makes network planning easy and allows greater flexibility. You can install up to 4 Gigabit Ethernet ports and 24 Fast Ethernet ports. Optional front or rear wiring makes the PT-7828 suitable for different applications.

## Package Checklist

The PowerTrans PT-7828 is shipped with the following items. If any of these items is missing or damaged, please contact your customer service representative for assistance.

- 1 PowerTrans PT-7828
- Hardware installation guide
- CD-ROM with user's manual and SNMP MIB file
- Warranty statement
- RJ45-to-DB9 console port cable
- Protective caps for unused ports
- 2 rackmount attachments

## Software Features

- Static routing and RIP V1/V2 supported
- Turbo Ring and RSTP/STP (IEEE 802.1W/D)
- IGMP snooping, GMRP to filter multicast traffic from industrial Ethernet protocols
- IEEE 802.1Q VLAN, GVRP for easier network planning
- QoS-IEEE 802.1p/1Q and TOS/DiffServ to increase determinism
- 802.3ad, LACP for bandwidth optimization
- IEEE 802.1X and https/SSL to enhance network security
- SNMP V1/V2c/V3 for differential network management
- RMON for efficient, proactive network monitoring
- Supports ABC-01 for system configuration backup
- Access restriction by MAC address
- Port mirroring for online debugging
- Automatic warnings by email, relay output
- Automatic recovery of connected device's IP addresses
- Line-swap fast recovery
- Configuration through web browser, Telnet/serial console, Windows utility, and ABC-01

# 2

## Getting Started

---

This chapter explains how the initial installation process for the PT-7828. There are three ways to access PT-7828's configuration settings: the serial console, Telnet console, and web console. If you do not know the PT-7828's IP address, you can open the serial console by connecting the PT-7828 to a PC's COM port with a short serial cable. You can open the Telnet or web console over an Ethernet LAN or over the Internet.

The following topics are covered:

- ☐ **Serial Console Configuration (115200, None, 8, 1, VT100)**
- ☐ **Configuration by Telnet Console**
- ☐ **Configuration by Web Browser**
- ☐ **Disabling Telnet and Browser Access**

## Serial Console Configuration (115200, None, 8, 1, VT100)

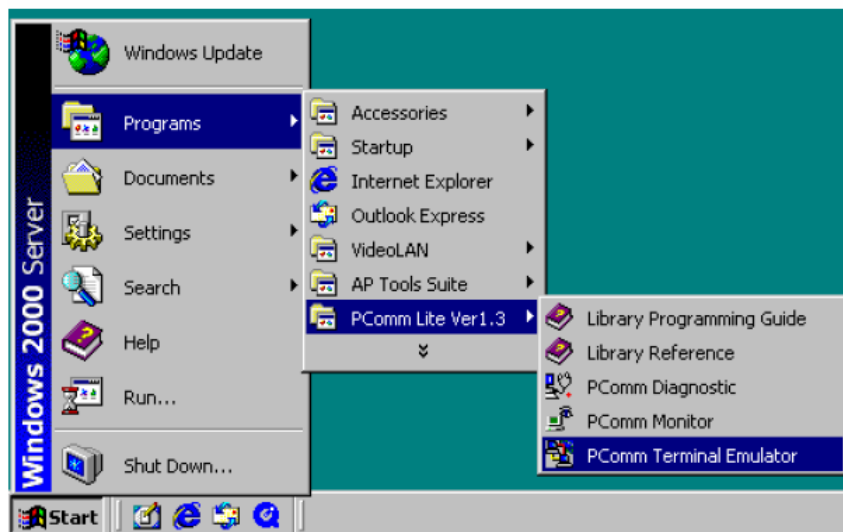

- NOTE
- You **cannot** connect to the serial and Telnet console at the same time.
  - You **can** connect to the web console and another console (serial or Telnet) at the same time. However, it is strongly recommended that you do NOT do so. Following this advice will allow you to maintain better control over the PT-7828's configuration.

- NOTE
- We recommend using PComm Terminal Emulator when opening the serial console. This software can be downloaded free of charge from the Moxa website.

Before running PComm Terminal Emulator, use an RJ45 to DB9-F (or RJ45 to DB25-F) cable to connect the PT-7828's console port to your PC's COM port (generally COM1 or COM2, depending on how your system is set up).

After installing PComm Terminal Emulator, open the PT-7828's serial console as follows:

1. From the Windows desktop, click **Start → Programs → PComm Lite 1.3 → Terminal Emulator**.

2. Select **Open** under the **Port Manager** menu to open a new connection.

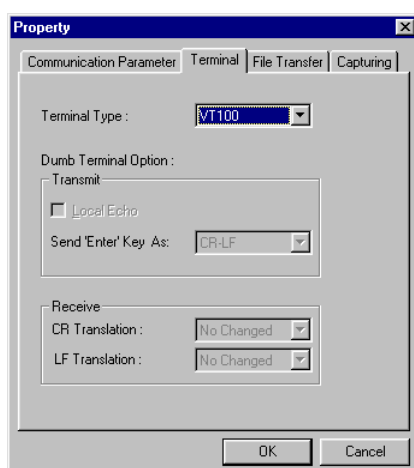

3. The **Property** window should open. On the **Communication Parameter** tab for **Ports**, select the COM port that is being used for the console connection. Set the other fields as follows: **115200** for **Baud Rate**, **8** for **Data Bits**, **None** for **Parity**, and **1** for **Stop Bits**.

4. On the **Terminal** tab, select **VT100** for **Terminal Type**. Click **OK**.

5. In the terminal window, the PT-7828 will prompt you to select a terminal type. Enter **1** to select **ansi/vt100** and press **Enter**.

```
MOXA EtherDevice Switch PT-7828
Console terminal type (1: ansi/vt100, 2: vt52) : 1
```

6. The serial console will prompt you to log in. Press **Enter** and select **admin** or **user**. Use the down arrow key on your keyboard to select the **Password** field and enter a password if desired. This password will be required to access any of the consoles (web, serial, Telnet). If you do not wish to create a password, leave the **Password** field blank and press **Enter**.

```

Model : PT-7828
Name : Managed Redundant Switch 00000
Location : Switch Location

Firmware Version : V1.1
Serial No : 00000
IP : 192.168.127.253
MAC Address : 00-90-18-B8-11-22

+-----+
+-----+ | admin | +-----+
| Account : [admin] | user | |
| Password : +-----+ |
+-----+

```

7. The **Main Menu** of the PT-7828's serial console should appear. (In PComm Terminal Emulator, you can adjust the font by selecting **Font...** in the **Edit** menu.)

```

PT-7828 series V1.1
-----
1.Basic Settings - Basic settings for network and system parameter.
2.Port Trunking - Allows multiple ports to be aggregated as a link.
3.SNMP Settings - The settings for SNMP.
4.Comm. Redundancy - Establish Ethernet communication redundant path.
5.Traffic Prioritization- Prioritize Ethernet traffic to help determinism.
6.Virtual LAN - Set up a VLAN by IEEE802.1Q VLAN.
7.Multicast Filtering - Enable the multicast filtering capability.
8.Bandwidth Management - Restrict unpredictable network traffic.
9.Port Access Control - Port access control by IEEE802.1X or Static Port Lock.
a.IP Filter - The settings for IP Filter.
b.Auto Warning - Warning email and/or relay output by events.
c.Line Swap - Fast recovery after moving devices to different ports.
d.Set Device IP - Assign IP addresses to connected devices.
e.Diagnosis - Test network integrity and mirroring port.
f.Monitor - Monitor a port and network status.
g.MAC Address Table - The complete table of Ethernet MAC Address List.
h.Layer 3 Settings - Layer 3 settings for interfaces and routing protocols.
i.System log - The setting for System log, and Event log.
j.Exit - Exit
- Use the up/down arrow keys to select a category,
and then press Enter to select. -

```

8. Use the following keys on your keyboard to navigate the PT-7828's serial console:

| Key                                     | Function                   |
|---|----------------------------|
| Up, down, right, left arrow keys<br>Tab | Move the onscreen cursor   |
| Enter                                   | Display and select options |
| Space                                   | Toggle options             |
| Esc                                     | Previous menu              |

## Configuration by Telnet Console

You may open the PT-7828's Telnet or web console over a network. This requires that the PC host and PT-7828 are on the same logical subnet. You may need to adjust your PC host's IP address and subnet mask. By default, the PT-7828's IP address is 192.168.127.253 and PT-7828's subnet mask is 255.255.255.0 (for a Class C network). This means that your PC's IP address must be set to 192.168.xxx.xxx for a subnet mask of 255.255.0.0, or to 192.168.127.xxx with a subnet mask of 255.255.255.0.

**NOTE** To connect to the PT-7828's Telnet or web console, your PC host and the PT-7828 must be on the same logical subnet.

**NOTE** When connecting to the PT-7828's Telnet or web console, first connect one of PT-7828's Ethernet ports to your Ethernet LAN or directly to your PC's Ethernet port. You may use either a straight-through or cross-over Ethernet cable.

**NOTE** The PT-7828's default IP address is **192.168.127.253**.

After making sure that the PT-7828 is connected to the same LAN and logical subnet as your PC, open the PT-7828's Telnet console as follows:

1. Click **Start → Run** from the Windows Start menu. Telnet to the PT-7828's IP address from the Windows **Run** window. You may also issue the Telnet command from a DOS prompt.

2. In the terminal window, the Telnet console will prompt you to select a terminal type. Type **1** to choose **ansi/vt100**, and then press **Enter**.

```
MOXA EtherDevice Switch PT-7828
Console terminal type (1: ansi/vt100, 2: vt52) : 1
```

- The Telnet console will prompt you to log in. Press **Enter** and select **admin** or **user**. Use the down arrow key on your keyboard to select the **Password** field and enter a password if desired. This password will be required to access any of the consoles (web, serial, Telnet). If you do not wish to create a password, leave the **Password** field blank and press **Enter**.

```

Model : PT-7828
Name : Managed Redundant Switch 00000
Location : Switch Location

Firmware Version : V1.1
Serial No : 00000
IP : 192.168.127.253

- Use the up/down arrow keys to select a category,
and then press Enter to select. -

```

- In the terminal window, select **Preferences...** from the **Terminal** menu on the menu bar.
- The **Terminal Preferences** window should appear. Make sure that **VT100 Arrows** is checked.

7. Use the following keys on your keyboard to navigate the PT-7828's Telnet console:

| Key                                     | Function                   |
|---|----------------------------|
| Up, down, right, left arrow keys<br>Tab | Move the onscreen cursor   |
| Enter                                   | Display and select options |
| Space                                   | Toggle options             |
| Esc                                     | Previous menu              |

**NOTE** The Telnet console looks and operates in precisely the same manner as the serial console.

## Configuration by Web Browser

The PT-7828's web console is a convenient way to modify the configuration and access the built-in monitoring and network administration functions. You can open the PT-7828's web console using a standard web browser such as Internet Explorer or Netscape.

**NOTE** To connect to the PT-7828's Telnet or web console, your PC host and the PT-7828 must be on the same logical subnet.

**NOTE** If the PT-7828 is configured for other VLAN settings, you must make sure your PC host is on the management VLAN.

**NOTE** When connecting to the PT-7828's Telnet or web console, first connect one of PT-7828's Ethernet ports to your Ethernet LAN or directly to your PC's Ethernet port. You may use either a straight-through or cross-over Ethernet cable.

**NOTE** The PT-7828's default IP address is **192.168.127.253**.

After making sure that the PT-7828 is connected to the same LAN and logical subnet as your PC, open the PT-7828's web console as follows:

1. Point your web browser to the PT-7828's IP address by entering it in the **Address** or **URL** field.

- The PT-7828's web console will open, and you will be prompted to log in. Select the login account (admin or user) and enter the **Password**. This password will be required to access any of the consoles (web, serial, Telnet). If you do not wish to create a password, leave the **Password** field blank and press **Enter**.

**NOTE** By default, no password is assigned to the PT-7828's web, serial, and Telnet consoles.

- After logging in, you may need to wait a few moments for the web console to appear. Use the folders in the left navigation panel to navigate between different pages of configuration options.

## Disabling Telnet and Browser Access

If you are connecting the PT-7828 to a public network but do not intend to manage it over the network, we suggest disabling both the Telnet and web consoles. This is done through the serial console, by navigating to **System Identification** under **Basic Settings**. Disable or enable the **Telnet Console** and **Web Configuration** as shown below:

| MOXA EtherDevice Switch PT-7828  |                                  |
|--|----------------------------------|
| Basic Settings   |                                  |
| [System] [Password] [Accessible IP] [Port] [Network] [Time] [Backup Media] |                                  |
| [Restart] [Factory default] [Upgrade] [Activate] [Main menu]               |                                  |
| System Identification  |                                  |
| ESC: Previous menu Enter: Select Space bar: Toggle                         |                                  |
| Switch Name  | [Managed Redundant Switch 00000] |
| Switch Location  | [Switch Location ]               |
| Switch Description   | [ ]                              |
| Maintainer Contact Info  | [ ]                              |
| Serial NO.   | 00000                            |
| Firmware Version   | V1.1                             |
| MAC Address  | 00-90-18-B8-11-22                |
| Telnet Console   | [Enable ]                        |
| Web Configuration  | [http or https]                  |

## Featured Functions

---

This chapter explains how to access PT-7828's various configuration, monitoring, and administration functions. These functions can be accessed by serial, Telnet, or web console. The serial console can be used if you do not know PT-7828's IP address and requires that you connect the PT-7828 to a PC COM port. The Telnet and web consoles can be opened over an Ethernet LAN or the Internet.

The web console is the most user-friendly way to configure PT-7828. In this chapter, we use the web console interface to introduce the functions. There are only a few differences between the web console, serial console, and Telnet console.

The following topics are covered in this chapter:

- ☐ **Configuring Basic Settings**
- ☐ **Using Port Trunking**
- ☐ **Configuring SNMP**
- ☐ **Using Communication Redundancy**
- ☐ **Using Traffic Prioritization**
- ☐ **Using Virtual LAN**
- ☐ **Using Multicast Filtering**
- ☐ **Using Bandwidth Management**
- ☐ **Using Port Access Control**
- ☐ **Using IP Filter**
- ☐ **Using Auto Warning**
- ☐ **Using Line-Swap-Fast-Recovery**
- ☐ **Using Set Device IP**
- ☐ **Using Diagnosis**
- ☐ **Using Monitor**
- ☐ **Using the MAC Address Table**
- ☐ **Using Event Log**
- ☐ **Using Syslog**
- ☐ **Using HTTPS/SSL**
- ☐ **Using Layer 3 Settings**

## Configuring Basic Settings

Basic Settings includes the most common settings required by administrators to maintain and control the PT-7828.

### System Identification

System Identification items are displayed at the top of the web console and will be included in alarm emails. You can set the System Identification items to make it easier to identify different switches that are connected to your network.

#### Switch Name

| Setting            | Description  | Factory Default   |
|--------------------|--|---|
| Max. 30 characters | This option is useful for differentiating between the roles or applications of different units. Example: Factory Switch 1. | Managed Redundant Switch<br>[Serial no. of this switch] |

#### Switch Location

| Setting            | Description   | Factory Default |
|--------------------|---|-----------------|
| Max. 80 characters | This option is useful for differentiating between the locations of different units. Example: production line 1. | Switch Location |

#### Switch Description

| Setting            | Description  | Factory Default |
|--------------------|--|-----------------|
| Max. 30 characters | This option is useful for recording a more detailed description of the unit. | None            |

#### Maintainer Contact Info

| Setting            | Description  | Factory Default |
|--------------------|--|-----------------|
| Max. 30 characters | This option is useful for providing information about who is responsible for maintaining this unit and how to contact this person. | None            |

## Password

The PT-7828 provides two levels of configuration access. The **admin** account has read/write access of all configuration parameters, and the **user** account has read access only. The **user** account can only view the configuration, but will not be able to make modifications.

### ATTENTION

By default, no password is assigned to the PT-7828's web, Telnet, and serial consoles. If a password is assigned, you will be required to enter the password when you open the serial console, Telnet console, or Web console.

#### Account

| Setting | Description   | Factory Default |
|---------|---|-----------------|
| Admin   | This account can <i>modify</i> the PT-7828's configuration.     | admin           |
| User    | This account can only <i>view</i> the PT-7828's configurations. |                 |

#### Password

| Setting                                 | Description  | Factory Default |
|---|--|-----------------|
| Old password<br>(max. 16 characters)    | Enter the current password   | None            |
| New password<br>(Max. 16 characters)    | Enter the desired new password. Leave it blank if you want to remove the password.       | None            |
| Retype password<br>(Max. 16 characters) | Enter the desired new password again. Leave it blank if you want to remove the password. | None            |

## Accessible IP

The PT-7828 uses an IP address-based filtering method to control access.

**Accessible IP List**

☐ Enable the accessible IP list ("Disable" will allow all IP's connection)

| Index | IP | NetMask |
|-------|----|---------|
| 1     |    |         |
| 2     |    |         |
| 3     |    |         |
| 4     |    |         |
| 5     |    |         |
| 6     |    |         |
| 7     |    |         |
| 8     |    |         |
| 9     |    |         |
| 10    |    |         |

**Activate**

You may add or remove IP addresses to limit access to the PT-7828. When the accessible IP list is enabled, only addresses on the list will be allowed access to the PT-7828. Each IP address and netmask entry can be tailored for different situations:

- Grant access to one host with a specific IP address**  
 For example, enter IP address 192.168.1.1 with netmask 255.255.255.255 to allow access to 192.168.1.1 only.
- Grant access to any host on a specific subnetwork**  
 For example, enter IP address 192.168.1.0 with netmask 255.255.255.0 to allow access to all IPs on the subnet defined by this IP address/subnet mask combination.
- Grant access to all hosts**  
 Make sure the accessible IP list is not enabled. Remove the checkmark from **Enable the accessible IP list**.

The following table shows additional configuration examples:

| Hosts That Need Access         | Input Format                    |
|--------------------------------|---------------------------------|
| Any host                       | Disable                         |
| 192.168.1.120                  | 192.168.1.120 / 255.255.255.255 |
| 192.168.1.1 to 192.168.1.254   | 192.168.1.0 / 255.255.255.0     |
| 192.168.0.1 to 192.168.255.254 | 192.168.0.0 / 255.255.0.0       |
| 192.168.1.1 to 192.168.1.126   | 192.168.1.0 / 255.255.255.128   |
| 192.168.1.129 to 192.168.1.254 | 192.168.1.128 / 255.255.255.128 |

## Port

**Port** settings are included to give the user control over port access, port transmission speed, flow control, and port type (MDI or MDIX).

**Port Settings**

| Port | Enable                              | Description       | Name | Speed     | FDX Flow Ctrl | MDI/MDIX |
|------|-------------------------------------|-------------------|------|-----------|---------------|----------|
| 1-1  | <input checked="" type="checkbox"/> | 100FX, SC, Multi. |      | 100M-Full | Disable       | Auto     |
| 1-2  | <input checked="" type="checkbox"/> | 100FX, SC, Multi. |      | 100M-Full | Disable       | Auto     |
| 1-3  | <input checked="" type="checkbox"/> | 100TX, RJ45.      |      | Auto      | Disable       | Auto     |
| 1-4  | <input checked="" type="checkbox"/> | 100TX, RJ45.      |      | Auto      | Disable       | Auto     |
| 1-5  | <input checked="" type="checkbox"/> | 100TX, RJ45.      |      | Auto      | Disable       | Auto     |
| 1-6  | <input checked="" type="checkbox"/> | 100TX, RJ45.      |      | Auto      | Disable       | Auto     |
| 4-1  | <input checked="" type="checkbox"/> | 1000TX, RJ45.     |      | Auto      | Disable       | Auto     |
| 4-2  | <input checked="" type="checkbox"/> | 1000TX, RJ45.     |      | Auto      | Disable       | Auto     |
| 4-3  | <input checked="" type="checkbox"/> | 1000TX, RJ45.     |      | Auto      | Disable       | Auto     |
| 4-4  | <input checked="" type="checkbox"/> | 1000TX, RJ45.     |      | Auto      | Disable       | Auto     |

**Activate**

### Enable

| Setting   | Description                                     | Factory Default |
|-----------|---|-----------------|
| Checked   | This allows data transmission through the port. | Enabled         |
| Unchecked | This immediately shuts off port access.         |                 |

### ATTENTION

If a connected device or sub-network is wreaking havoc on the rest of the network, the **Disable** option under **Advanced Settings/Port** gives the administrator a quick way to shut off access through this port immediately.

### Description

| Setting    | Description   | Factory Default |
|------------|---|-----------------|
| Media type | This displays the media type for each module's port | N/A             |

### Name

| Setting            | Description   | Factory Default |
|--------------------|---|-----------------|
| Max. 63 characters | This specifies an alias for the port to help administrators differentiate between different ports. Example: PLC 1 | None            |

*Speed*

| Setting   | Description   | Factory Default |
|-----------|---|-----------------|
| Auto      | This allows the port to use the IEEE 802.3u protocol to negotiate with connected devices. The port and connected devices will determine the best speed for that connection. | Auto            |
| 100M-Full | Choose one of these fixed speed options if the connected Ethernet device has trouble auto-negotiating for line speed.   |                 |
| 100M-Half |   |                 |
| 10M-Full  |   |                 |
| 10M-Half  |   |                 |

*FDX Flow Ctrl*

This setting enables or disables flow control for the port when the port's **Speed** is set to **Auto**. The final result will be determined by the **Auto** process between the PT-7828 and connected devices.

| Setting | Description   | Factory Default |
|---------|---|-----------------|
| Enable  | This enables flow control for this port when the port's <b>Speed</b> is set to <b>Auto</b> .  | Disable         |
| Disable | This disables flow control for this port when the port's <b>Speed</b> is set to <b>Auto</b> . |                 |

*MDI/MDIX*

| Setting | Description  | Factory Default |
|---------|--|-----------------|
| Auto    | This allows the port to auto-detect the port type of the connected Ethernet device and change the port type accordingly. | Auto            |
| MDI     | Choose MDI or MDIX if the connected Ethernet device has trouble auto-negotiating for port type.                          |                 |
| MDIX    |  |                 |

## Network

**Network** settings allow users to modify the usual TCP/IP network parameters.

### Network Parameters

#### General Settings

Auto IP Configuration

Disable

Switch IP Address

192.168.127.253

Switch Subnet Mask

255.255.255.0

Default Gateway

1st DNS Server IP Address

2nd DNS Server IP Address

Activate

*Auto IP Configuration*

| Setting  | Description  | Factory Default |
|----------|--|-----------------|
| Disable  | Select this to set the PT-7828's IP address manually.                                  | Disable         |
| By DHCP  | The PT-7828's IP address will be assigned automatically by the network's DHCP server.  |                 |
| By BootP | The PT-7828's IP address will be assigned automatically by the network's BootP server. |                 |

*Switch IP Address*

| Setting                    | Description  | Factory Default |
|----------------------------|--|-----------------|
| IP address for the PT-7828 | This assigns the PT-7828's IP address on a TCP/IP network. | 192.168.127.253 |

*Switch Subnet Mask*

| Setting                     | Description  | Factory Default |
|-----------------------------|--|-----------------|
| Subnet mask for the PT-7828 | This identifies the type of network to which the PT-7828 is connected (e.g., 255.255.0.0 for a Class B network, or 255.255.255.0 for a Class C network). | 255.255.255.0   |

*Default Gateway*

| Setting                | Description  | Factory Default |
|------------------------|--|-----------------|
| IP address for gateway | This specifies the IP address of the router that connects the LAN to an outside network. | None            |

*DNS IP Address*

| Setting                       | Description  | Factory Default |
|-------------------------------|--|-----------------|
| IP address for DNS server     | This specifies the IP address of the DNS server used by your network. After specifying the DNS server's IP address, you can use the PT-7828's URL (e.g., www.PT.company.com) to open the web console instead of entering the IP address. | None            |
| IP address for 2nd DNS server | This specifies the IP address of the secondary DNS server used by your network. The PT-7828 will use the secondary DNS server if the first DNS server fails to connect.  | None            |

## Time

The PT-7828 has a time calibration function based on information from an NTP server or user specified time and date. Functions such as automatic warning emails can therefore include time and date stamp.

**NOTE** The PT-7828 does not have a real time clock. The user must update the **Current Time** and **Current Date** to set the initial time for PT-7828 after each reboot, especially when there is no NTP server on the LAN or Internet connection.

### *Current Time*

| Setting             | Description  | Factory Default |
|---------------------|--|-----------------|
| User-specified time | This allows configuration of the local time in local 24-hour format. | 00h:00m:00s     |

### *Current Date*

| Setting             | Description   | Factory Default |
|---------------------|---|-----------------|
| User-specified date | This allows configuration of the local date in yyyy-mm-dd format. | 1970/01/01      |

## Daylight Saving Time

The Daylight Saving Time settings are used to automatically offset the PT-7828's time forward according to national standards.

### *Start Date*

| Setting             | Description  | Factory Default |
|---------------------|--|-----------------|
| User-specified date | This specifies the date that Daylight Savings Time begins. | None            |

*End Date*

| Setting             | Description  | Factory Default |
|---------------------|--|-----------------|
| User-specified date | This specifies the date that Daylight Savings Time ends. | None            |

*Offset*

| Setting             | Description   | Factory Default |
|---------------------|---|-----------------|
| User-specified hour | This specifies the number of hours that the time should be offset forward during Daylight Savings Time. | None            |

*System Up Time*

This indicates how long the PT-7828 remained up since the last cold start. The up time is indicated in seconds.

*Time Zone*

| Setting   | Description  | Factory Default           |
|-----------|--|---------------------------|
| Time zone | This specifies the time zone, which is used to determine the local time offset from GMT (Greenwich Mean Time). | GMT (Greenwich Mean Time) |

**NOTE** Changing the time zone will automatically correct the current time. Make sure to set the time zone before setting the time.

*Time Server IP/Name*

| Setting                                     | Description   | Factory Default |
|---|---|-----------------|
| IP address or name of time server           | This is the IP or domain address (e.g., 192.168.1.1, time.stdtime.gov.tw, or time.nist.gov).      | None            |
| IP address or name of secondary time server | The PT-7828 will try to locate the secondary NTP server if the first NTP server fails to connect. |                 |

*Time Server Query Period*

| Setting      | Description   | Factory Default |
|--------------|---|-----------------|
| Query period | This parameter determines how frequently the time is updated from the NTP server. | 600 seconds     |

## System File Update—By Remote TFTP

The PT-7828 supports saving your configuration or log file to a remote TFTP server or local host. Other PT-7828 switches can also load the configuration at a later time. The PT-7828 also supports loading firmware or configuration files from the TFTP server or a local host.

### Update System Files by TFTP

|                                   |                      |   |
|-----------------------------------|----------------------|---|
| TFTP Server IP/Name               | <input type="text"/> |   |
| Configuration Files Path and Name | <input type="text"/> | <input type="button" value="Download"/> <input type="button" value="Upload"/> |
| Firmware Files Path and Name      | <input type="text"/> | <input type="button" value="Download"/>                                       |
| Log Files Path and Name           | <input type="text"/> | <input type="button" value="Upload"/>   |

#### *TFTP Server IP/Name*

| Setting                   | Description  | Factory Default |
|---------------------------|--|-----------------|
| IP address of TFTP server | This specifies the IP address or name of the remote TFTP server. This must be specified before downloading or uploading files. | None            |

#### *Configuration Files Path and Name*

| Setting            | Description   | Factory Default |
|--------------------|---|-----------------|
| Max. 40 characters | This specifies the path and file name of the PT-7828's configuration file on the TFTP server. | None            |

#### *Firmware Files Path and Name*

| Setting            | Description   | Factory Default |
|--------------------|---|-----------------|
| Max. 40 characters | This specifies the path and file name of the PT-7828's firmware file. | None            |

#### *Log Files Path and Name*

| Setting            | Description  | Factory Default |
|--------------------|--|-----------------|
| Max. 40 characters | This specifies the path and file name of the PT-7828's log file. | None            |

After setting the desired paths and file names, click **Activate** to save the setting. Click **Download** to download the prepared file from the remote TFTP server, or click **Upload** to upload the desired file to the remote TFTP server.

## System File Update—By Local Import/Export

**Update System Files from Local PC**

|                       |                                       |                                       |                                       |
|-----------------------|---------------------------------------|---------------------------------------|---------------------------------------|
| Configuration File    | <input type="button" value="Export"/> |                                       |                                       |
| Log File              | <input type="button" value="Export"/> |                                       |                                       |
| Upgrade Firmware      | <input type="text"/>                  | <input type="button" value="Browse"/> | <input type="button" value="Import"/> |
| Upload Configure Data | <input type="text"/>                  | <input type="button" value="Browse"/> | <input type="button" value="Import"/> |

### *Configuration File*

Click **Export** to save the PT-7828's configuration file to the local host.

### *Log File*

Click **Export** to save the PT-7828's log file to the local host.

#### NOTE

Some operating systems will open the configuration file and log file directly in the web page. In such cases, right click the **Export** button to save the file.

### *Upgrade Firmware*

To import a new firmware file onto the PT-7828, click **Browse** to select the firmware file that is saved on your computer. The upgrade procedure will proceed automatically after clicking **Import**.

### *Upload Configure Data*

To import a configuration file onto the PT-7828, click **Browse** to select the configuration file already saved on your computer. The upgrade procedure will proceed automatically after clicking **Import**.

## System File Update - By Backup Media

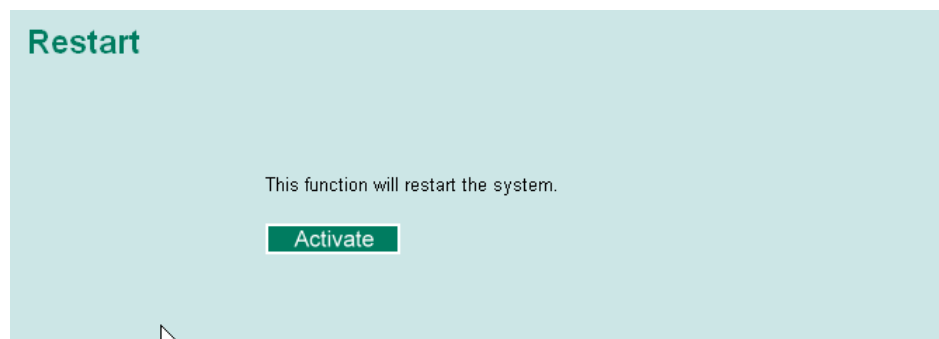

User can use Moxa's Automatic Backup Configurator to save and load the configuration of PT-7828 managed switches through the switch's RS-232 console port.

**ABC (Auto-Backup Configurator) Configuration**

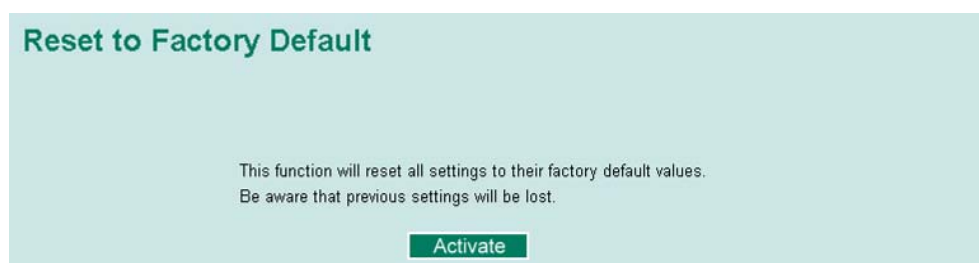

|  |   |
|--|---|
| <input checked="" type="checkbox"/> Auto load ABC's system configurations when system boots up | <input type="button" value="Activate"/> |
| Save the current configurations to ABC   | <input type="button" value="Save"/>     |
| Load the ABC's configurations to Switch  | <input type="button" value="Load"/>     |

## Restart

This Restart function provides users with a quick way to restart the system.

## Factory Default

This function provides users with a quick way of restoring the PT-7828's configuration to factory defaults. This function is available in the serial, Telnet, and web consoles.

|             |   |
|-------------|---|
| <b>NOTE</b> | After restoring the factory default configuration, you will need to use the default network settings to re-establish the web or Telnet console connection with the PT-7828. |
|-------------|---|

## Using Port Trunking

Link aggregation involves grouping links to into a link aggregation group. A MAC client can treat link aggregation groups as if they were a single link.

The PT-7828's port trunking feature allows devices to communicate by aggregating up to 4 trunk groups, with a maximum of 8 ports for each group. If one of the 8 ports fails, the other seven ports will automatically provide backup and share the traffic.

Port trunking can be used to combine up to 8 ports between two PT-7828 switches. If all ports on both switch units are configured as 100BaseTX and they are operating in full duplex, the potential bandwidth of the connection will be 1600 Mbps.

## The Port Trunking Concept

Moxa has developed a proprietary port trunking protocol that provides the following benefits:

- More flexibility in setting up your network connections, since the bandwidth of a link can be doubled, tripled, or quadrupled
- Redundancy — if one link is broken, the remaining trunked ports share the traffic within this trunk group

- Load sharing — MAC client traffic may be distributed across multiple links

To avoid broadcast storms or loops in your network while configuring a trunk, first disable or disconnect all ports that you want to add to the trunk or remove from the trunk. After you finish configuring the trunk, enable or re-connect the ports.

If all ports on both switch units are configured as 100BaseTX and they are operating in full duplex mode, the potential bandwidth of the connection will be up to 1.6 Gbps. This means that users can double, triple, or quadruple the bandwidth of the connection by port trunking between two PT series switches.

Each PT-7828 can set a maximum of 4 port trunking groups. When you activate port trunking, certain settings on each port will be reset to factory default values or disabled:

- Communication redundancy will be reset
- 802.1Q VLAN will be reset
- Multicast Filtering will be reset
- Port Lock will be reset and disabled.
- Set Device IP will be reset
- Mirror will be reset

After port trunking has been activated, you may configure these items again for each trunking ports.

## Configuring Port Trunking

The **Port Trunking Settings** page is where ports are assigned to a trunk group.

**Port Trunking Settings**

Trunk Group: Trk1 Trunk Type: Static

**Member Ports**

| Port | Enable | Description | Name | Speed | FDX Flow Ctrl |
|------|--------|-------------|------|-------|---------------|
|------|--------|-------------|------|-------|---------------|

Up Down

**Available Ports**

| Port                         | Enable | Description     | Name | Speed     | FDX Flow Ctrl |
|------------------------------|--------|-----------------|------|-----------|---------------|
| <input type="checkbox"/> 1-1 | Yes    | 100FX,SC,Multi. |      | 100M-Full | Disable       |
| <input type="checkbox"/> 1-2 | Yes    | 100FX,SC,Multi. |      | 100M-Full | Disable       |
| <input type="checkbox"/> 1-3 | Yes    | 100TX,RJ45.     |      | Auto      | Disable       |
| <input type="checkbox"/> 1-4 | Yes    | 100TX,RJ45.     |      | Auto      | Disable       |

Activate

**Step 1:** Select the desired **Trunk Group** (Trk1, Trk2, Trk3, Trk4).

**Step 2:** Select the **Trunk Type** (Static or LACP).

**Step 3:** Select the desired ports under **Available Ports** and click **Up** to add to the Trunk Group.

**Step 4:** Select the desired ports under **Member Ports** and click **Down** to remove from the group.

**Trunk Group (Maximum of 4 trunk groups)**

| Setting                | Description                             | Factory Default |
|------------------------|---|-----------------|
| Trk1, Trk2, Trk3, Trk4 | This specifies the current trunk group. | Trk1            |

**Trunk Type**

| Setting | Description  | Factory Default |
|---------|--|-----------------|
| Static  | This selects Moxa's proprietary trunking protocol.                   | Static          |
| LACP    | This selects LACP (IEEE 802.3ad, Link Aggregation Control Protocol). | Static          |

**Available Ports/Member Ports**

| Setting                | Description  | Factory Default |
|------------------------|--|-----------------|
| Member/available ports | This lists the ports in the current trunk group and the ports that are available to be added.      | N/A             |
| Check box              | This selects the port to be added or removed from the group.                                       | Unchecked       |
| Port                   | This is how each port is identified.   | N/A             |
| Port description       | This displays the media type for each port.  | N/A             |
| Name                   | This displays the specified name for each port.  | N/A             |
| Speed                  | This indicates the transmission speed for each port (100M-Full, 100M-Half, 10M-Full, or 10M-Half). | N/A             |
| FDX flow control       | This indicates if the FDX flow control of this port is enabled or disabled.                        | N/A             |
| Up                     | This is used to add selected ports into the trunk group from available ports.                      | N/A             |
| Down                   | This is used to remove selected ports from the trunk group.  | N/A             |

**Trunk Table**

| Trunk Group      | Member Port | Status |
|------------------|-------------|--------|
| Trk1<br>(Static) | 1-1         | Fail   |
|                  | 1-2         | Fail   |
|                  | 1-3         | Fail   |

**Trunk Table**

| Setting     | Description  |
|-------------|--|
| Trunk group | Displays the trunk type and trunk group.   |
| Member port | Displays the member ports that belong to the trunk group.  |
| Status      | <b>Success</b> means port trunking is working properly.<br><b>Fail</b> means port trunking is not working properly.<br><b>Standby</b> means port trunking is working as a standby port. When there are more than eight ports trunked as a trunking group, the 9 <sup>th</sup> port will be the standby port. |

## Configuring SNMP

The PT-7828 supports SNMP V1, V2c, and V3. SNMP V1 and SNMP V2c use a community string match for authentication, which means that SNMP servers access all objects with read-only or read/write permissions using the community strings *public* and *private* by default. SNMP V3 requires that you select an authentication level of MD5 or SHA, and is the most secure protocol. You can also enable data encryption to enhance data security.

Supported SNMP security modes and levels are shown in the following table. Select the security mode and level that will be used to communicate between the SNMP agent and manager.

| Protocol Version | UI Setting                   | Authentication                     | Encryption          | Method  |
|------------------|------------------------------|------------------------------------|---------------------|---|
| SNMP V1, V2c     | V1, V2c Read Community       | Community string                   | No                  | This uses a community string match for authentication.  |
|                  | V1, V2c Write/Read Community | Community string                   | No                  | This uses a community string match for authentication.  |
| SNMP V3          | No-Auth                      | No                                 | No                  | This uses an account with admin or user to access objects   |
|                  | MD5 or SHA                   | Authentication based on MD5 or SHA | No                  | This provides authentication based on HMAC-MD5, or HMAC-SHA algorithms. 8-character passwords are the minimum requirement for authentication.   |
|                  | MD5 or SHA                   | Authentication based on MD5 or SHA | Data encryption key | This provides authentication based on HMAC-MD5 or HMAC-SHA algorithms, and data encryption key. 8-character passwords and a data encryption key are the minimum requirements for authentication and encryption. |

These parameters are configured on the SNMP page. A more detailed explanation of each parameter is given below the figure.

**SNMP**

**SNMP Read/Write Settings**

SNMP Versions: V1, V2c

V1,V2c Read Community: public

V1,V2c Write/Read Community: private

## SNMP Read/Write Settings

### SNMP Versions

| Setting                             | Description   | Factory Default |
|-------------------------------------|---|-----------------|
| V1, V2c, V3, or V1, V2c, or V3 only | This specifies the SNMP protocol version used to manage the switch. | V1, V2c         |

### V1, V2c Read Community

| Setting            | Description   | Factory Default |
|--------------------|---|-----------------|
| Max. 30 characters | This specifies the community string to authenticate the SNMP agent for read-only access. The SNMP agent will access all objects with read-only permissions using this community string. | Public          |

### V1, V2c Write/Read Community

| Setting            | Description  | Factory Default |
|--------------------|--|-----------------|
| Max. 30 characters | This specifies the community string to authenticate the SNMP agent for read/write access. The SNMP server will access all objects with read/write permissions using this community string. | Private         |

For SNMP V3, there are two levels of privilege for different accounts to access the PT-7828. **Admin** privilege provides access and authorization to read and write the MIB file. **User** privilege allows reading of the MIB file only.

*Admin Auth. Type (for SNMP V1, V2c, V3, and V3 only)*

| Setting  | Description  | Factory Default |
|----------|--|-----------------|
| No-Auth  | This allows the admin account to access objects without authentication.  | No              |
| MD5-Auth | Authentication will be based on the HMAC-MD5 algorithms. 8-character passwords are the minimum requirement for authentication. | No              |
| SHA-Auth | Authentication will be based on the HMAC-SHA algorithms. 8-character passwords are the minimum requirement for authentication. | No              |

*Admin Data Encryption Key (for SNMP V1, V2c, V3, and V3 only)*

| Setting | Description   | Factory Default |
|---------|---|-----------------|
| Enable  | This enables data encryption using the specified data encryption key (between 8 and 30 characters). | No              |
| Disable | This specifies that data will not be encrypted.   | No              |

*User Auth. Type (for SNMP V1, V2c, V3 and V3 only)*

| Setting  | Description  | Factory Default |
|----------|--|-----------------|
| No-Auth  | This allows the admin account and user account to access objects without authentication.                                       | No              |
| MD5-Auth | Authentication will be based on the HMAC-MD5 algorithms. 8-character passwords are the minimum requirement for authentication. | No              |
| SHA-Auth | Authentication will be based on the HMAC-SHA algorithms. 8-character passwords are the minimum requirement for authentication. | No              |

*User Data Encryption Key (for SNMP V1, V2c, V3 and V3 only)*

| Setting | Description   | Factory Default |
|---------|---|-----------------|
| Enable  | This enables data encryption using the specified data encryption key (between 8 and 30 characters). | No              |
| Disable | No data encryption  | No              |

## Trap Settings

*1<sup>st</sup> Trap Server IP/Name*

| Setting    | Description  | Factory Default |
|------------|--|-----------------|
| IP or name | This specifies the IP address or name of the primary trap server used by your network. | None            |

*1<sup>st</sup> Trap Community*

| Setting            | Description  | Factory Default |
|--------------------|--|-----------------|
| Max. 30 characters | This specifies the community string to use for authentication. | Public          |

*2nd Trap Server IP/Name*

| Setting    | Description  | Factory Default |
|------------|--|-----------------|
| IP or name | This specifies the IP address or name of the secondary trap server used by your network. | None            |

*2nd Trap Community*

| Setting            | Description  | Factory Default |
|--------------------|--|-----------------|
| Max. 30 characters | This specifies the community string to use for authentication. | Public          |

## Private MIB information

*Switch Object ID*

| Setting   | Description                                    | Factory Default |
|-----------|--|-----------------|
| 8691.7.15 | This indicates the PT-7828's enterprise value. | Fixed           |

**NOTE:** *The Switch Object ID cannot be changed.*

## Using Communication Redundancy

Communication redundancy on your network helps protect critical links against failure, protects against network loops, and keeps network downtime at a minimum.

Communication redundancy functions allow the user to set up *redundant loops* in the network to provide a backup data transmission route in the event that a cable is inadvertently disconnected or damaged. This is a particularly important feature for industrial applications, since it could take several minutes to locate the disconnected or severed cable. For example, if the PT-7828 is used as a key communications component of a production line, several minutes of downtime can result in a big loss in production and revenue. The PT-7828 supports three different protocols for communication redundancy—**Rapid Spanning Tree Protocol (IEEE-802.1w)** and **Turbo Ring**, and **Turbo Ring V2**.

When configuring a redundant ring, all switches on the same ring must be configured using the same redundancy protocol. You cannot mix the Turbo Ring, Turbo Ring V2, and STP/RSTP protocols within a ring. The following table lists the key differences between each feature. Use this information to evaluate each the benefits of each, and then determine which features are most suitable for your network.

|               | Turbo Ring V2 | Turbo Ring | STP           | RSTP        |
|---------------|---------------|------------|---------------|-------------|
| Topology      | Ring          | Ring       | Ring, Mesh    | Ring, Mesh  |
| Recovery Time | < 20 ms       | < 300 ms   | Up to 30 sec. | Up to 5 sec |

|      |  |
|------|--|
| NOTE | <p>Most managed switches by Moxa support two proprietary Turbo Ring protocols:</p> <ul style="list-style-type: none"> <li>• <b>Turbo Ring</b> refers to the original version of Moxa's proprietary redundant ring protocol, which has a recovery time of under 300 ms.</li> <li>• <b>Turbo Ring V2</b> refers to the new generation Turbo Ring, which has a recovery time of under 20 ms.</li> </ul> |
|------|--|

## The Turbo Ring Concept

Moxa developed the proprietary Turbo Ring protocol to optimize communication redundancy and achieve a faster recovery time on the network.

The Turbo Ring and Turbo Ring V2 protocols designate one switch as the *master* of the network, and then automatically block packets from traveling through any of the network's redundant loops. In the event that one branch of the ring gets disconnected from the rest of the network, the protocol automatically readjusts the ring so that the part of the network that was disconnected can reestablish contact with the rest of the network.

### Initial setup for Turbo Ring or Turbo Ring V2

1. For each switch in the ring, select any two ports as the redundant ports.
2. Connect redundant ports on neighboring switches to form the redundant ring.

The user does not need to manually assign the master with Turbo Ring or Turbo Ring V2. If no switch is assigned as the master, the protocol automatically selects one of the switches to be the master. The master is only used to identify which segment in the redundant ring acts as the backup path. In the following subsections, we explain how the redundant path is selected for rings configured for Turbo Ring and Turbo Ring V2.

### Determining the Redundant Path for Turbo Ring

In this case, the redundant segment (i.e., the segment that will be blocked during normal operation) is determined by the number of PT series Ethernet switches in the ring and by the location of the master switch.

**Turbo Ring with even number of switches**

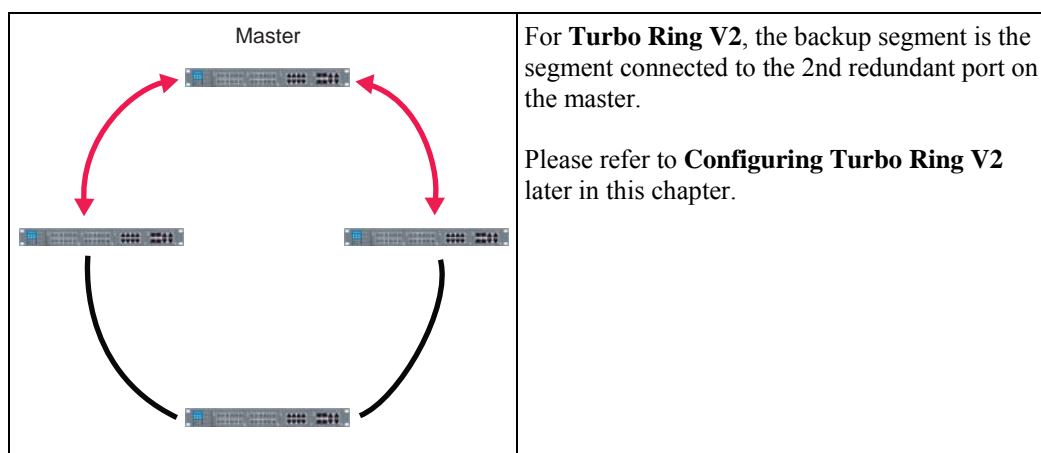

If the number of Ethernet switches in the Turbo Ring is  $2N$  (an even number), the backup segment is one of the two segments connected to the  $(N+1)$ st switch (i.e., the unit directly opposite the master).

**Turbo Ring with odd number switches**

If the number of Ethernet switches in the Turbo Ring is  $2N+1$  (an odd number), the backup segment is the  $(N+1)$ st segment counting counterclockwise.

For the example shown here,  $N=1$ , so that  $N+1=2$ .

### Determining the Redundant Path for Turbo Ring V2

### Ring Coupling Configuration

For some systems, it may not be convenient to connect all devices in the system in a single redundant ring, since some devices could be located in a remote area. For these systems, **Ring Coupling** can be used to group devices into smaller redundant rings that communicate with each other.

#### ATTENTION

In a VLAN environment, the user must set **Redundant Port Coupling Port** and **Coupling Control Port** to join all VLANs, since these ports act as the **backbone** to transmit all packets of different VLANs to the different PT series Ethernet switches.

### Ring Coupling for Turbo Ring

To configure the ring coupling for a **Turbo Ring**, select two PT series Ethernet switches (e.g., Switch A and B in the above figure) in the ring, and another two PT series Ethernet switches in the adjacent ring (e.g., Switch C and D).

Select two ports on each switch to be used as coupling ports and link them together. Next, assign one switch (e.g., Switch A) to be the **coupler** and connect the coupler's coupling control port with Switch B (for this example).

The coupler switch (i.e., Switch A) will monitor switch B through the coupling control port to determine whether or not the coupling port's backup path should be recovered.

Note that the ring coupling settings for a **Turbo Ring V2** are different from a **Turbo Ring**. For Turbo Ring V2, ring coupling is enabled by configuring the **Coupling Port (Primary)** on Switch B and the **Coupling Port (Backup)** on Switch A only. You do not need to set up a coupling control port, so **Turbo Ring V2** does not require a coupling control line.

The **Coupling Port (Backup)** on Switch A is used for the backup path and connects directly to a network port on Switch C. The **Coupling Port (Primary)** on Switch B monitors the status of the main path, and connects directly to an extra network port on Switch D. With ring coupling established, Switch A can activate the backup path as soon as it detects a problem with the main path.

#### ATTENTION

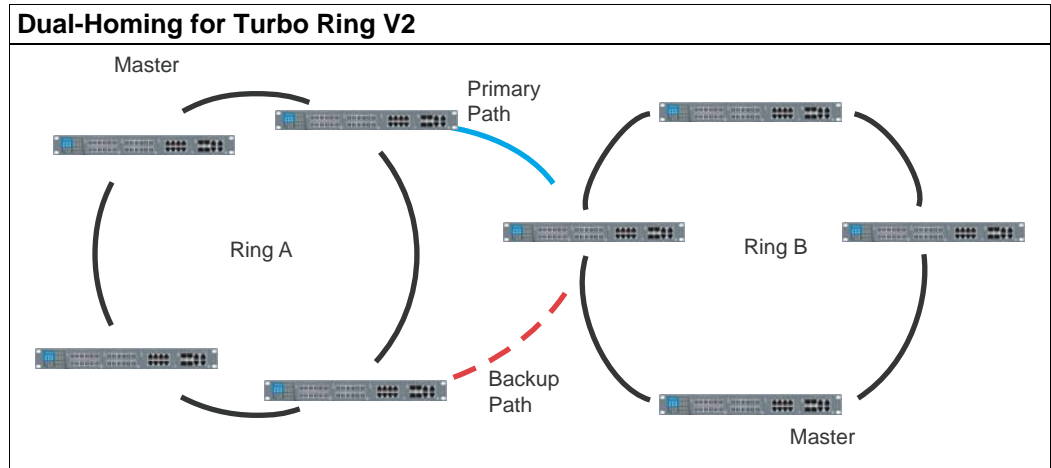

Ring coupling only needs to be enabled on one of the switches serving as the ring coupler. The coupler must assign separate ports for the two Turbo Ring ports and the coupling port.

#### NOTE

You do not need to use the same PT series Ethernet switch for both ring coupling and ring master.

Dual-Homing Configuration for Turbo Ring V2

**Dual-homing** is only supported with Turbo Ring V2 and is used to connect two networks through a single Ethernet switch. The primary path is the operating connection, and the backup path is a back-up connection that is activated in the event that the primary path connection fails.

Configuring Turbo Ring and Turbo Ring V2

On the **Communication Redundancy** page, select **Turbo Ring** or **Turbo Ring V2** as the **Redundancy Protocol**. Note that each protocol's configuration page is different.

Configuring Turbo Ring

**Communication Redundancy**

**Activate**

**"Current Status" Items*****Now Active***

This shows which communication protocol is in use: **Turbo Ring**, **Turbo Ring V2**, **RSTP**, or **none**.

***Master/Slave***

This indicates whether or not the PT-7828 is the master of the Turbo Ring. This field appears only for Turbo Ring or Turbo Ring V2.

**NOTE**

The user does not need to assign the master to use Turbo Ring or Turbo Ring V2. If no master is assigned, the Turbo Ring protocol will automatically assign master status to one of the PT series Ethernet switches in the ring. The master is only used to determine which segment serves as the backup path.

***Redundant Ports Status (1st Port, 2nd Port)******Ring Coupling Ports Status (Coupling Port, Coupling Control Port)***

The **Ports Status** indicators show **Forwarding** for normal transmission, **Blocking** if the port is part of a backup path that is currently blocked, and **Link down** if there is no connection.

**"Settings" Items*****Redundancy Protocol***

| Setting               | Description                              | Factory Default |
|-----------------------|--|-----------------|
| Turbo Ring            | This selects the Turbo Ring protocol.    | None            |
| Turbo Ring V2         | This selects the Turbo Ring V2 protocol. |                 |
| RSTP (IEEE 802.1w/1D) | This selects the RSTP protocol.          |                 |
| None                  | This disables ring redundancy.           |                 |

***Set as Master***

| Setting  | Description  | Factory Default |
|----------|--|-----------------|
| Enabled  | The PT-7828 is manually selected as the master.                                | Not checked     |
| Disabled | The Turbo Ring or Turbo Ring V2 protocol will automatically select the master. |                 |

***Redundant Ports***

| Setting  | Description   | Factory Default |
|----------|---|-----------------|
| 1st Port | This specifies which port on the PT-7828 will be used as the first redundant port.  | None            |
| 2nd Port | This specifies which port on the PT-7828 will be used as the second redundant port. | None            |

*Enable Ring Coupling*

| Setting | Description  | Factory Default |
|---------|--|-----------------|
| Enable  | This specifies that this PT-7828 will be a ring coupler. | Not checked     |
| Disable | This specifies that this PT-7828 is not a ring coupler.  |                 |

*Coupling Port*

| Setting       | Description   | Factory Default |
|---------------|---|-----------------|
| Coupling Port | This specifies which port on the PT-7828 will be used as the coupling port. | None            |

*Coupling Control Port*

| Setting               | Description   | Factory Default |
|-----------------------|---|-----------------|
| Coupling Control Port | This specifies which port on the PT-7828 will be used as the coupling control port. | None            |

**Settings**

Redundancy Protocol: Turbo Ring V2

☒ Enable Ring 1 ☐ Enable Ring 2

☐ Set as Master ☐ Set as Master

Redundant Ports 1st Port: 4-3 2nd Port: 4-4

Redundant Ports 1st Port: 4-1 2nd Port: 4-2

☐ Enable Ring Coupling

Coupling Mode: Dual Homing

Primary Port: 4-1 Backup Port: 4-1

**Activate**

**NOTE** When using a dual-ring architecture, users must complete configuration for both Ring 1 and Ring 2. The status of both rings will appear under **Current Status**.

**"Current Status" Items*****Now Active***

This shows which communication protocol is in use: **Turbo Ring**, **Turbo Ring V2**, **RSTP**, or **none**.

***Ring 1/2—Status***

This shows **Healthy** if the ring is operating normally, and shows **Break** if the ring's backup link is active.

***Ring 1/2—Master/Slave***

This indicates whether or not the PT-7828 is the master of the Turbo Ring. This field appears only when selected to operate in Turbo Ring or Turbo Ring V2 mode.

**NOTE**

The user does not need to assign the master to use Turbo Ring or Turbo Ring V2. If no master is assigned, the Turbo Ring protocol will automatically assign master status to one of the PT series Ethernet switches in the ring. The master is only used to determine which segment serves as the backup path.

***Ring 1/2—1st Ring Port Status******Ring 1/2—2nd Ring Port Status***

The **Ports Status** indicators show **Forwarding** for normal transmission, **Blocking** if this port is connected to a backup path and the path is blocked, and **Link down** if there is no connection.

***Coupling—Mode***

This indicates either **None**, **Dual Homing**, or **Ring Coupling**.

***Coupling—Coupling Port status***

This indicates either **Primary**, or **Backup**.

**"Settings" Items*****Redundancy Protocol***

| Ring Coupling (backup)  | This specifies that the PT-7828 will be used for a ring coupling backup connection.  | None            |
| Ring Coupling (primary) | This specifies that the PT-7828 will be used for a ring coupling primary connection. | None            |

#### *Primary/Backup Port*

| Setting      | Description   | Factory Default |
|--------------|---|-----------------|
| Primary Port | This specifies which port on the PT-7828 will be used as primary port.    | None            |
| Backup Port  | This specifies which port on the PT-7828 will be used as the backup port. | None            |

## The STP/RSTP Concept

Spanning Tree Protocol (STP) was designed to help reduce link failures in a network and provide protection from loops. Networks that have a complicated architecture are prone to broadcast storms caused by unintended loops in the network. The PT-7828's STP feature is disabled by default. To be completely effective, you must enable RSTP/STP on every PT-7828 connected to your network.

Rapid Spanning Tree Protocol (RSTP) implements the Spanning Tree Algorithm and Protocol defined by IEEE Std 802.1w-2001. RSTP provides the following benefits:

- The topology of a bridged network will be determined much more quickly compared to STP.
- RSTP is backward compatible with STP, making it relatively easy to deploy. For example:
  - It defaults to sending 802.1D style BPDUs if packets with this format are received.
  - STP (802.1D) and RSTP (802.1w) can operate on different ports of the same PT-7828. This feature is particularly helpful when PT-7828 ports connect to older equipment, such as legacy switches.

You get essentially the same functionality with RSTP and STP. To see how the two systems differ, please refer to *Differences between RSTP and STP* later in this chapter.

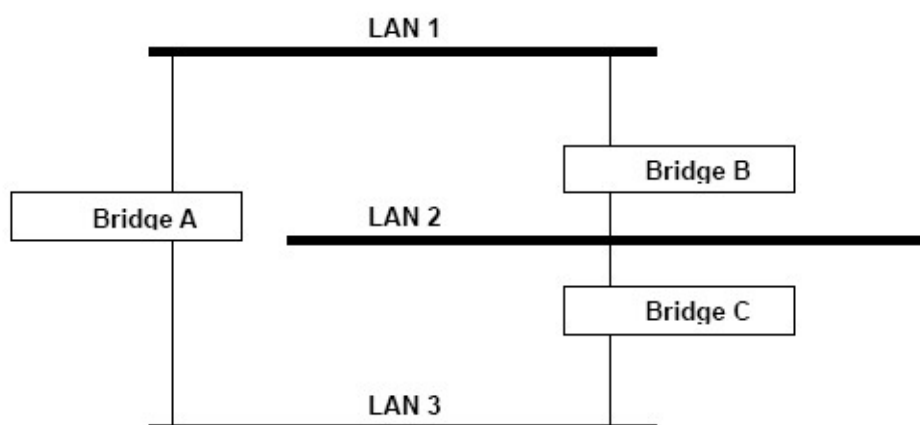

|             |  |
|-------------|--|
| <b>NOTE</b> | The STP protocol is part of the IEEE Std 802.1D, 1998 Edition bridge specification. The explanation given below uses bridge instead of switch. |
|-------------|--|

### What is STP?

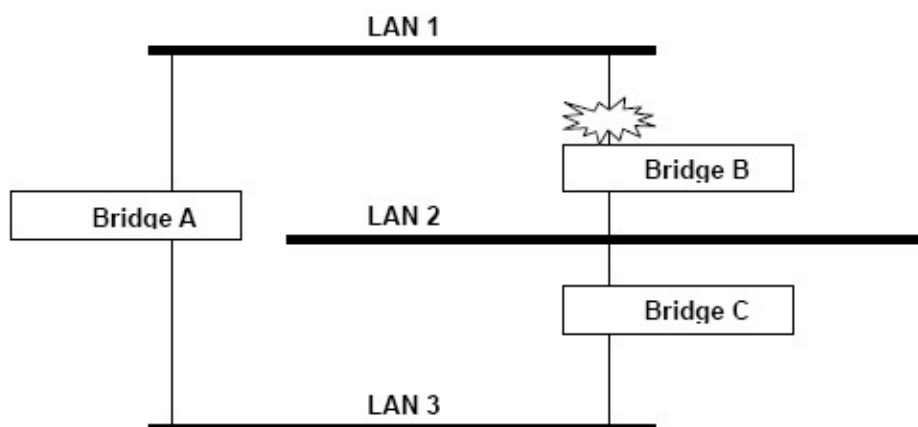

STP (802.1D) is a bridge-based system that is used to implement parallel paths for network traffic. STP uses a loop-detection process to:

- Locate and then disable less efficient paths (i.e., paths that have a lower bandwidth)
- Enable one of the less efficient paths if the most efficient path fails

The figure below shows a network made up of three LANs separated by three bridges. Each segment uses at most two paths to communicate with the other segments. Since this configuration can give rise to loops, the network will overload if STP is not enabled.

If STP is enabled, it will detect duplicate paths and prevent, or block, one of them from forwarding traffic. In the following example, STP determined that traffic from LAN segment 2 to LAN segment 1 should flow through Bridges C and A because this path has a greater bandwidth and is therefore more efficient.

What happens if a link failure is detected? As shown in next figure, the STP process reconfigures the network so that traffic from LAN segment 2 flows through Bridge B.

STP will determine which path between each bridged segment is most efficient, and then assign a specific reference point on the network. When the most efficient path has been identified, the other paths are blocked. In the above 3 figures, STP first determined that the path through Bridge C was the most efficient, and as a result, blocked the path through Bridge B. After the failure of Bridge C, STP re-evaluated the situation and opened the path through Bridge B.

## How STP Works

When enabled, STP determines the most appropriate path for traffic through a network. The method is described below:

### STP Requirements

Before STP can configure the network, the system must satisfy the following requirements:

- Communication must be established between all bridges. This communication is carried out using Bridge Protocol Data Units (BPDUs), which are transmitted in packets with a known multicast address.
- Each bridge must have a Bridge Identifier that specifies which bridge acts as the central reference point, or Root Bridge, for the STP system. Bridges with a lower Bridge Identifier are more likely to be designated as the Root Bridge. The Bridge Identifier is calculated using the MAC address of the bridge and a priority defined for the bridge. The default priority of PT-7828 is 32768.
- Each port has a cost that specifies the efficiency of each link. The efficiency cost is usually determined by the bandwidth of the link, with less efficient links assigned a higher cost. The following table shows the default port costs for a switch:

| Port Speed | Path Cost 802.1D,<br>1998 Edition | Path Cost<br>802.1w-2001 |
|------------|-----------------------------------|--------------------------|
| 10 Mbps    | 100                               | 2,000,000                |
| 100 Mbps   | 19                                | 200,000                  |
| 1000 Mbps  | 4                                 | 20,000                   |

### STP Calculation

The first step of the STP process is to perform calculations. During this stage, each bridge on the network transmits BPDUs. The following items will then be calculated:

- The bridge that will act as the Root Bridge. The Root Bridge is the central reference point from which the network is configured.
- The Root Path Costs for each bridge. This is the cost of the paths from each bridge to the Root Bridge.
- The identity of each bridge's Root Port. The Root Port is the port on the bridge that connects to the Root Bridge via the most efficient path. In other words, this port connects to the Root Bridge via the path with the lowest Root Path Cost. The Root Bridge itself does not have a Root Port.
- The identity of the Designated Bridge for each LAN segment. The Designated Bridge is the bridge with the lowest Root Path Cost from that segment. If several bridges have the same Root Path Cost, the one with the lowest Bridge Identifier becomes the Designated Bridge. Traffic transmitted in the direction of the Root Bridge will flow through the Designated Bridge. The port on this bridge that connects to the segment is called the Designated Bridge Port.

### STP Configuration

After all the bridges on the network agree on the identity of the Root Bridge and all relevant parameters have been established, each bridge is configured to forward traffic only between its Root Port and the Designated Bridge Ports for their respective network segments. All other ports are blocked, which means that they will not be allowed to receive or forward traffic.

### STP Reconfiguration

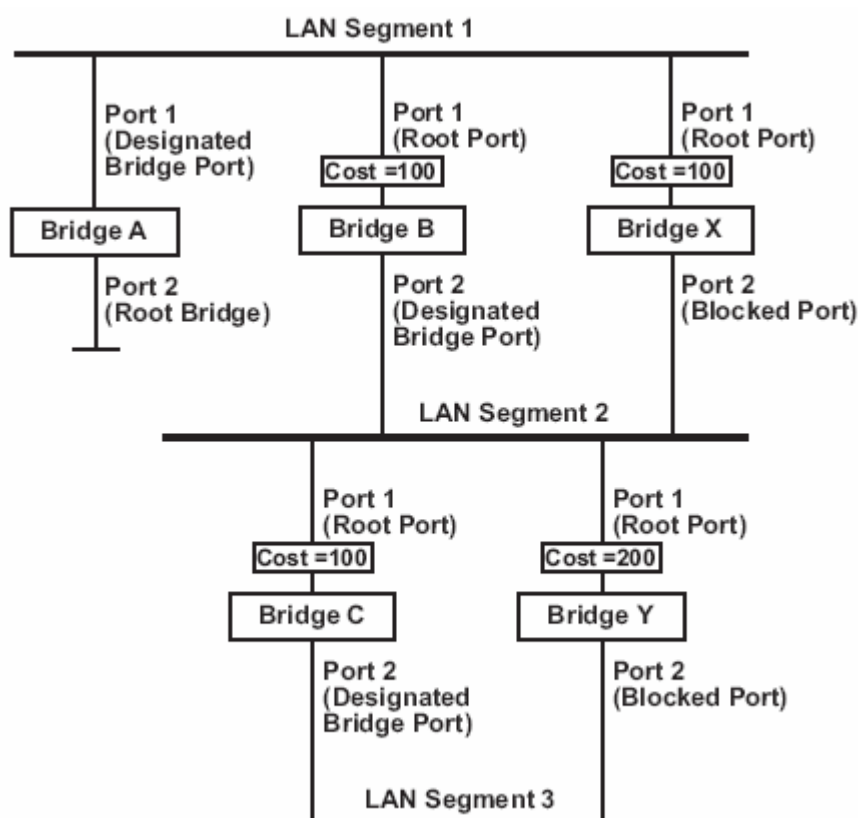

Once the network topology has stabilized, each bridge listens for "Hello" BPDUs that are transmitted from the Root Bridge at regular intervals. If a bridge does not receive a "Hello" BPDU after a certain interval (the Max Age time), the bridge assumes that the Root Bridge, or a link between itself and the Root Bridge, has gone down. This will trigger the bridge to reconfigure the network to account for the change. If you have configured an SNMP trap destination, the first bridge to detect a topology change in your network sends out an SNMP trap.

### Differences between RSTP and STP

RSTP is similar to STP, but includes additional information in the BPDUs that allow each bridge to confirm that it has taken action to prevent loops from forming when it decides to enable a link to a neighboring bridge. Adjacent bridges connected via point-to-point links will be able to enable a link without waiting to ensure that all other bridges in the network have had time to react to the change. The main benefit of RSTP is that the configuration decision is made locally rather than network-wide, allowing RSTP can carry out automatic configuration and restore a link faster than STP.

### STP Example

The LAN shown below has three segments, with adjacent segments connected using two possible links. The various STP factors, such as Cost, Root Port, Designated Bridge Port, and Blocked Port are shown in the figure.

- Bridge A has been selected as the Root Bridge, since it was determined to have the lowest Bridge Identifier on the network.
- Since Bridge A is the Root Bridge, it is also the Designated Bridge for LAN segment 1. Port 1 on Bridge A is selected as the Designated Bridge Port for LAN Segment 1.
- Ports 1 of Bridges B, C, X, and Y are all Root Ports since they are nearest to the Root Bridge, and therefore have the most efficient path.
- Bridges B and X offer the same Root Path Cost for LAN segment 2. However, Bridge B was selected as the Designated Bridge for that segment since it has a lower Bridge Identifier. Port 2 on Bridge B is selected as the Designated Bridge Port for LAN Segment 2.
- Bridge C is the Designated Bridge for LAN segment 3, because it has the lowest Root Path Cost for LAN Segment 3:
  - The route through Bridges C and B costs 200 (C to B=100, B to A=100)
  - The route through Bridges Y and B costs 300 (Y to B=200, B to A=100)
- The Designated Bridge Port for LAN Segment 3 is Port 2 on Bridge C.

### Using STP on a Network with Multiple VLANs

IEEE Std 802.1D, 1998 Edition, does not take into account VLANs when calculating STP information—the calculations only depend on the physical connections. Consequently, some network configurations will result in VLANs being subdivided into a number of isolated sections by the STP system. You must ensure that every VLAN configuration on your network takes into account the expected STP topology and alternative topologies that may result from link failures.

The following figure shows an example of a network that contains VLANs 1 and 2. The VLANs are connected using the 802.1Q-tagged link between Switch B and Switch C. By default, this link has a port cost of 100 and is automatically blocked because the other Switch-to-Switch connections have a port cost of 36 (18+18). This means that both VLANs are now subdivided—VLAN 1 on Switch units A and B cannot communicate with VLAN 1 on Switch C, and VLAN 2 on Switch units A and C cannot communicate with VLAN 2 on Switch B.

To avoid subdividing VLANs, all inter-switch connections should be made members of all available 802.1Q VLANs. This will ensure connectivity at all times. For example, the connections between Switches A and B, and between Switches A and C should be 802.1Q tagged and carrying VLANs 1 and 2 to ensure connectivity.

See the **Configuring Virtual LANs** section for more information about VLAN Tagging.

## Configuring STP/RSTP

The following figures indicate which Spanning Tree Protocol parameters can be configured. A more detailed explanation of each parameter is given below the figure.

**Communication Redundancy**

**Current Status**

Root/Not root ---

**Settings**

Redundancy Protocol RSTP (IEEE 802.1W/1D) ▼

Bridge Priority 32768 ▼ Hello Time 2

Forwarding Delay 15 Max Age 20

| Port | Enable RSTP              | Port Priority | Port Cost | Status |
|------|--------------------------|---------------|-----------|--------|
| 4-1  | <input type="checkbox"/> | 128 ▼         | 20000     | ---    |
| 4-2  | <input type="checkbox"/> | 128 ▼         | 20000     | ---    |
| 4-3  | <input type="checkbox"/> | 128 ▼         | 200000    | ---    |
| 4-4  | <input type="checkbox"/> | 128 ▼         | 200000    | ---    |

Activate

At the top of this page, the user can check the **Current Status** of this function. For RSTP, you will see:

### **Now Active:**

This field shows which communication protocol is being used—Turbo Ring, RSTP, or neither.

### **Root/Not Root**

This field appears only for RSTP mode. It indicates whether or not this PT-7828 is the Root of the Spanning Tree (the root is determined automatically).

At the bottom of this page, the user can configure the **Settings** for the selected protocol. For RSTP, you can configure:

### **Protocol of Redundancy**

| Setting               | Description                           | Factory Default |
|-----------------------|---------------------------------------|-----------------|
| Turbo Ring            | This selects the Turbo Ring protocol. | None            |
| RSTP (IEEE 802.1W/1D) | This selects the RSTP protocol.       | None            |

### **Bridge Priority**

| Setting                          | Description  | Factory Default |
|----------------------------------|--|-----------------|
| Numerical value selected by user | This specifies the PT-7828's bridge priority. A lower number means a higher priority, which means a greater chance of being established as the root of the Spanning Tree topology. | 32768           |

*Forwarding Delay*

| Setting                       | Description  | Factory Default |
|-------------------------------|--|-----------------|
| Numerical value input by user | This specifies the amount of time this device will wait before checking to see if it should change to a different state. | 15 (sec.)       |

*Hello Time (sec.)*

| Setting                       | Description   | Factory Default |
|-------------------------------|---|-----------------|
| Numerical value input by user | This specifies the time interval between "hello" messages broadcast by the root of the Spanning Tree topology. The "hello" message is used to check if the topology is healthy. | 2               |

*Max. Age (sec.)*

| Setting                       | Description  | Factory Default |
|-------------------------------|--|-----------------|
| Numerical value input by user | This specifies the amount of time to wait for a "hello" message from the root before the PT-7828 will reconfigure itself as a root. When two or more devices on the network are recognized as a root, the devices will renegotiate to set up a new Spanning Tree topology. | 20              |

*Enable STP per Port*

| Setting        | Description  | Factory Default |
|----------------|--|-----------------|
| Enable/Disable | This includes the selected port as a node on the Spanning Tree topology. | Disabled        |

**NOTE**

We suggest that you disable the Spanning Tree Protocol for ports that are connected directly to a device (PLC, RTU, etc.) as opposed to network equipment. This will prevent unnecessary negotiation.

*Port Priority*

| Setting                          | Description   | Factory Default |
|----------------------------------|---|-----------------|
| Numerical value selected by user | This specifies the port's priority as a node on the Spanning Tree topology. Lower values correspond to higher priority. | 128             |

*Port Cost*

| Setting                       | Description  | Factory Default |
|-------------------------------|--|-----------------|
| Numerical value input by user | This specifies the port cost. Higher costs correspond to lower suitability as a node for the Spanning Tree topology. | 200000          |

### Port Status

Indicates the current Spanning Tree status of this port. **Forwarding** indicates normal transmission and **Blocking** indicates blocked transmission.

## Configuration Limits of RSTP/STP

The Spanning Tree Algorithm places limits on three of the configuration items:

[Eq. 1]:  $1 \text{ sec} \leq \text{Hello Time} \leq 10 \text{ sec}$

[Eq. 2]:  $6 \text{ sec} \leq \text{Max. Age} \leq 40 \text{ sec}$

[Eq. 3]:  $4 \text{ sec} \leq \text{Forwarding Delay} \leq 30 \text{ sec}$

These three variables are further restricted by the following two inequalities:

[Eq. 4]:  $2 * (\text{Hello Time} + 1 \text{ sec}) \leq \text{Max. Age} \leq 2 * (\text{Forwarding Delay} - 1 \text{ sec})$

The PT-7828's firmware will alert you immediately if any of these restrictions are violated. For example, suppose Hello Time = 5 sec, Max. Age = 20 sec, and Forwarding Delay = 4 sec. This does not violate Eqs. 1 through 3, but it violates Eq. 4:

$2 * (\text{Hello Time} + 1 \text{ sec}) = 12 \text{ sec}$ , and  $2 * (\text{Forwarding Delay} - 1 \text{ sec}) = 6 \text{ sec}$ .

You can remedy the situation in any number of ways. One solution is simply to increase the Forwarding Delay value to at least 11 seconds.

*HINT:* Take the following steps to avoid guessing:

**Step 1:** Assign a value to “**Hello Time**” and then calculate the left most part of Eq. 4 to get the lower limit of **Max. Age**.

**Step 2:** Assign a value to “**Forwarding Delay**” and then calculate the right most part of Eq. 4 to get the upper limit for **Max. Age**.

**Step 3:** Assign a value to **Forwarding Delay** that satisfies the conditions in Eq. 3 and Eq. 4.

## Using Traffic Prioritization

The PT-7828's traffic prioritization capability provides Quality of Service (QoS) to your network by making data delivery more reliable. You can prioritize traffic on your network to ensure that high priority data is transmitted with minimum delay. Traffic can be controlled by a set of rules to obtain the required Quality of Service for your network. The rules define different types of traffic and specify how each type should be treated as it passes through the switch. The PT-7828 can inspect both IEEE 802.1p/1Q layer 2 CoS tags, and even layer 3 TOS information to provide consistent classification of the entire network. The PT-7828's QoS capability improves the performance and determinism of industrial networks for mission critical applications.

## The Traffic Prioritization Concept

### What is Traffic Prioritization?

Traffic prioritization allows you to prioritize data so that time-sensitive and system-critical data can be transferred smoothly and with minimal delay over a network. The benefits of using traffic prioritization are:

- Improve network performance by controlling a wide variety of traffic and managing congestion.
- Assign priorities to different categories of traffic. For example, set higher priorities for time-critical or business-critical applications.

- Provide predictable throughput for multimedia applications, such as video conferencing or voice over IP, and minimize traffic delay and jitter.
- Improve network performance as the amount of traffic grows. This will save cost by reducing the need to keep adding bandwidth to the network.

## How Traffic Prioritization Works

Traffic prioritization uses the four traffic queues that are present in your PT-7828 to ensure that high priority traffic is forwarded on a different queue from lower priority traffic. This is what provides Quality of Service (QoS) to your network.

The PT-7828 traffic prioritization depends on two industry-standard methods:

- **IEEE 802.1D**—a layer 2 marking scheme.
- **Differentiated Services (DiffServ)**—a layer 3 marking scheme.

### IEEE 802.1D Traffic Marking

The IEEE Std 802.1D, 1998 Edition marking scheme, which is an enhancement to IEEE Std 802.1D, enables Quality of Service on the LAN. Traffic service levels are defined in the IEEE 802.1Q 4-byte tag, which is used to carry VLAN identification as well as IEEE 802.1p priority information. The 4-byte tag immediately follows the destination MAC address and Source MAC address.

The IEEE Std 802.1D, 1998 Edition priority marking scheme assigns an IEEE 802.1p priority level between 0 and 7 to each frame. This determines the level of service that that type of traffic should receive. Refer to the table below for an example of how different traffic types can be mapped to the eight IEEE 802.1p priority levels.

| IEEE 802.1p Priority Level | IEEE 802.1D Traffic Type  |
|----------------------------|---|
| 0                          | Best Effort (default)   |
| 1                          | Background  |
| 2                          | Standard (spare)  |
| 3                          | Excellent Effort (business critical)  |
| 4                          | Controlled Load (streaming multimedia)                                      |
| 5                          | Video (interactive media); less than 100 milliseconds of latency and jitter |
| 6                          | Voice (interactive voice); less than 10 milliseconds of latency and jitter  |
| 7                          | Network Control Reserved traffic  |

Even though the IEEE 802.1D standard is the most widely used prioritization scheme in the LAN environment, it still has some restrictions:

- It requires an additional 4-byte tag in the frame, which is normally optional in Ethernet networks. Without this tag, the scheme cannot work.
- The tag is part of the IEEE 802.1Q header, so to implement QoS at layer 2, the entire network must implement IEEE 802.1Q VLAN tagging.

It is only supported on a LAN and not across routed WAN links, since the IEEE 802.1Q tags are removed when the packets pass through a router.

**Differentiated Services (DiffServ) Traffic Marking**

DiffServ is a Layer 3 marking scheme that uses the DiffServ Code Point (DSCP) field in the IP header to store the packet priority information. DSCP is an advanced intelligent method of traffic marking because you can choose how your network prioritizes different types of traffic. DSCP uses 64 values that map to user-defined service levels, allowing you to establish more control over network traffic.

Advantages of DiffServ over IEEE 802.1D are:

- Configure how you want your switch to treat selected applications and types of traffic by assigning various grades of network service to them.
- No extra tags are required in the packet.
- DSCP uses the IP header of a packet and therefore priority is preserved across the Internet.
- DSCP is backward compatible with IPV4 TOS, which allows operation with existing devices that use a layer 3 TOS enabled prioritization scheme.

**Traffic Prioritization**

The PT-7828 classifies traffic based on layer 2 of the OSI 7 layer model, and the switch prioritizes received traffic according to the priority information defined in the received packet. Incoming traffic is classified based upon the IEEE 802.1D frame and is assigned to the appropriate priority queue based on the IEEE 802.1p service level value defined in that packet. Service level markings (values) are defined in the IEEE 802.1Q 4-byte tag, and consequently traffic will only contain 802.1p priority markings if the network is configured with VLANs and VLAN tagging. The traffic flow through the switch is as follows:

- A packet received by the PT-7828 may or may not have an 802.1p tag associated with it. If it does not, then it is given a default 802.1p tag (which is usually 0). Alternatively, the packet may be marked with a new 802.1p value, which will result in all knowledge of the old 802.1p tag being lost.
- Because the 802.1p priority levels are fixed to the traffic queues, the packet will be placed in the appropriate priority queue, ready for transmission through the appropriate egress port. When the packet reaches the head of its queue and is about to be transmitted, the device determines whether or not the egress port is tagged for that VLAN. If it is, then the new 802.1p tag is used in the extended 802.1D header.

The PT-7828 will check a packet received at the ingress port for IEEE 802.1D traffic classification, and then prioritize it based upon the IEEE 802.1p value (service levels) in that tag. It is this 802.1p value that determines which traffic queue the packet is mapped to.

**Traffic Queues**

The PT-7828 hardware has multiple traffic queues that allow packet prioritization to occur. Higher priority traffic can pass through the PT-7828 without being delayed by lower priority traffic. As each packet arrives in the PT-7828, it passes through any ingress processing (which includes classification, marking/re-marking), and is then sorted into the appropriate queue. The switch then forwards packets from each queue.

The PT-7828 supports two different queuing mechanisms:

- Weight Fair: This method services all the traffic queues, giving priority to the higher priority queues. Under most circumstances, this method gives high priority precedence over low-priority, but in the event that high-priority traffic exceeds the link capacity, lower priority traffic is not blocked.
- Strict: This method services high traffic queues first; low priority queues are delayed until no more high priority data needs to be sent. This method always gives precedence to high priority over low-priority.

## Configuring Traffic Prioritization

Quality of Service (QoS) provides a traffic prioritization capability to ensure that important data is delivered consistently and predictably. The PT-7828 can inspect IEEE 802.1p/1Q layer 2 CoS tags, and even layer 3 TOS information, to provide a consistent classification of the entire network. The PT-7828's QoS capability improves your industrial network's performance and determinism for mission critical applications.

### QoS Classification

**QoS Classification**

Queuing Mechanism: Weight Fair(8:4:2:1)

| Port Group                       | Inspect ToS                         |
|----------------------------------|-------------------------------------|
| Group1 (1-1,1-2,1-3,1-4,1-5,1-6) | <input checked="" type="checkbox"/> |
| Group3 (3-1,3-2,3-3,3-4,3-5,3-6) | <input checked="" type="checkbox"/> |

| Port | Inspect CoS                         | Default Port Priority |
|------|-------------------------------------|-----------------------|
| 1-1  | <input checked="" type="checkbox"/> | 3(Normal)             |
| 1-2  | <input checked="" type="checkbox"/> | 3(Normal)             |
| 1-3  | <input checked="" type="checkbox"/> | 3(Normal)             |
| 1-4  | <input checked="" type="checkbox"/> | 3(Normal)             |
| 1-5  | <input checked="" type="checkbox"/> | 3(Normal)             |
| 1-6  | <input checked="" type="checkbox"/> | 3(Normal)             |

Activate

The PT-7828 supports inspection of layer 3 TOS and/or layer 2 CoS tag information to determine how to classify traffic packets.

#### Queuing Mechanism

| Setting     | Description   | Factory Default |
|-------------|---|-----------------|
| Weight Fair | PT-7828 has 4 priority queues. In the weight fair scheme, an 8, 4, 2, 1 weighting is applied to the four priorities. This approach prevents the lower priority frames from being starved of opportunity for transmission with only a slight delay to the higher priority frames.  | Weight Fair     |
| Strict      | In the Strict-priority scheme, all top-priority frames egress a port until that priority's queue is empty, and then the next lower priority queue's frames egress. This approach can cause the lower priorities to be starved of opportunity for transmitting any frames but ensures all high priority frames to egress the switch as soon as possible. |                 |

#### Inspect TOS

| Setting        | Description   | Factory Default |
|----------------|---|-----------------|
| Enable/Disable | This enables or disables the PT-7828 to inspect the Type of Service (TOS) bits in IPV4 frame to determine the priority of each frame. | Enable          |

*Inspect COS*

| Setting        | Description  | Factory Default |
|----------------|--|-----------------|
| Enable/Disable | This enables or disables the PT-7828 to inspect the 802.1p COS tag in the MAC frame to determine the priority of each frame. | Enable          |

**CoS Mapping**

Mapping Table of CoS Value and Priority Queues

| CoS | Priority Queue |
|-----|----------------|
| 0   | Low            |
| 1   | Low            |
| 2   | Normal         |
| 3   | Normal         |
| 4   | Medium         |
| 5   | Medium         |
| 6   | High           |
| 7   | High           |

Activate

| Setting                    | Description  | Factory  |
|----------------------------|--|--|
| Low/Normal/<br>Medium/High | This maps different CoS values to 4 different egress queues. | 0: Low<br>1: Low<br>2: Normal<br>3: Normal<br>4: Medium<br>5: Medium<br>6: High<br>7: High |

**TOS/DiffServ Mapping**

Mapping Table of ToS (DSCP) Value and Priority Queues

| ToS      | Level     | ToS      | Level     | ToS      | Level     | ToS      | Level     |
|----------|-----------|----------|-----------|----------|-----------|----------|-----------|
| 0x00(1)  | 0(Low)    | 0x04(2)  | 0(Low)    | 0x08(3)  | 0(Low)    | 0x0C(4)  | 0(Low)    |
| 0x10(5)  | 0(Low)    | 0x14(6)  | 0(Low)    | 0x18(7)  | 0(Low)    | 0x1C(8)  | 0(Low)    |
| 0x20(9)  | 1(Low)    | 0x24(10) | 1(Low)    | 0x28(11) | 1(Low)    | 0x2C(12) | 1(Low)    |
| 0x30(13) | 1(Low)    | 0x34(14) | 1(Low)    | 0x38(15) | 1(Low)    | 0x3C(16) | 1(Low)    |
| 0x40(17) | 2(Normal) | 0x44(18) | 2(Normal) | 0x48(19) | 2(Normal) | 0x4C(20) | 2(Normal) |
| 0x50(21) | 2(Normal) | 0x54(22) | 2(Normal) | 0x58(23) | 2(Normal) | 0x5C(24) | 2(Normal) |
| 0x60(25) | 3(Normal) | 0x64(26) | 3(Normal) | 0x68(27) | 3(Normal) | 0x6C(28) | 3(Normal) |
| 0x70(29) | 3(Normal) | 0x74(30) | 3(Normal) | 0x78(31) | 3(Normal) | 0x7C(32) | 3(Normal) |
| 0x80(33) | 4(Medium) | 0x84(34) | 4(Medium) | 0x88(35) | 4(Medium) | 0x8C(36) | 4(Medium) |
| 0x90(37) | 4(Medium) | 0x94(38) | 4(Medium) | 0x98(39) | 4(Medium) | 0x9C(40) | 4(Medium) |
| 0xA0(41) | 5(Medium) | 0xA4(42) | 5(Medium) | 0xA8(43) | 5(Medium) | 0xAC(44) | 5(Medium) |
| 0xB0(45) | 5(Medium) | 0xB4(46) | 5(Medium) | 0xB8(47) | 5(Medium) | 0xBC(48) | 5(Medium) |

Activate

| Setting                    | Description  | Factory Default  |
|----------------------------|--|--|
| Low/Normal/<br>Medium/High | This maps different TOS values to 4 different egress queues. | 1 to 16: Low<br>17 to 32: Normal<br>33 to 48: Medium<br>49 to 64: High |

## Using Virtual LAN

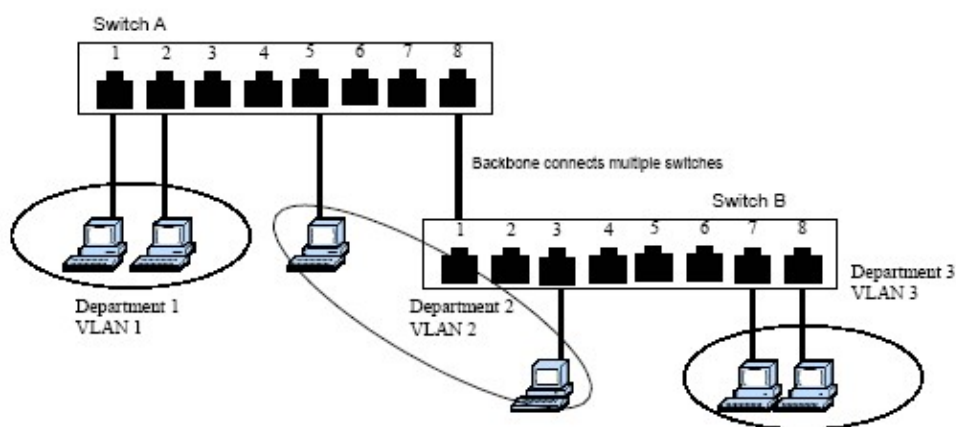

Setting up Virtual LANs (VLANs) on your PT-7828 increases the efficiency of your network by dividing the LAN into logical segments, as opposed to physical segments. In general, VLANs are easier to manage.

### The Virtual LAN (VLAN) Concept

#### What is a VLAN?

A VLAN is a group of devices that can be located anywhere on a network, but which communicate as if they are on the same physical segment. With VLANs, you can segment your network without being restricted by physical connections—a limitation of traditional network design. As an example, with VLANs you can segment your network according to:

- **Departmental groups**—You could have one VLAN for the marketing department, another for the finance department, and another for the product development department.
- **Hierarchical groups**—You could have one VLAN for directors, another for managers, and another for general staff.
- **Usage groups**—You could have one VLAN for email users and another for multimedia users.

## Benefits of VLANs

The main benefit of VLANs is that they provide a network segmentation system that is far more flexible than traditional networks. Using VLANs also provides you with three other benefits:

- **VLANs ease the relocation of devices on networks.** With traditional networks, network administrators spend much of their time dealing with moves and changes. If users move to a different subnetwork, the addresses of each host must be updated manually. With a VLAN setup, if a host on *VLAN Marketing*, for example, is moved to a port in another part of the network, and retains its original subnet membership, you only need to specify that the new port is on *VLAN Marketing*. You do not need to carry out any re-cabling.
- **VLANs provide extra security.** Devices within each VLAN can only communicate with other devices on the same VLAN. If a device on *VLAN Marketing* nePT to communicate with devices on *VLAN Finance*, the traffic must pass through a routing device or Layer 3 switch.
- **VLANs help control traffic.** With traditional networks, congestion can be caused by broadcast traffic that is directed to all network devices, regardless of whether or not they need it. VLANs increase the efficiency of your network because each VLAN can be set up to contain only those devices that need to communicate with each other.

## VLANs and the PowerTrans

Your PT-7828 provides support for VLANs using IEEE Std 802.1Q-1998. This standard allows traffic from multiple VLANs to be carried across one physical link. The IEEE Std 802.1Q-1998 standard allows each port on your PT-7828 to be placed as follows:

- In a single VLAN defined on the PT-7828
- In several VLANs simultaneously using 802.1Q tagging

The standard requires that you define the *802.1Q VLAN ID* about each VLAN on your PT-7828 before the switch can use it to forward traffic:

## Managing a VLAN

A new or initialized PT-7828 contains a single VLAN—the Default VLAN. This VLAN has the following definition:

- *VLAN Name*—Management VLAN
- *802.1Q VLAN ID*—1 (if tagging is required)

All the ports are initially placed in this VLAN, and it is the only VLAN that allows you to access the management software of the PT-7828 over the network.

## Communication Between VLANs

If devices connected to a VLAN need to communicate to devices on a different VLAN, a router or Layer 3 switching device with connections to both VLANs needs to be installed. Communication between VLANs can only take place if they are all connected to a routing or Layer 3 switching device.

## VLANs: Tagged and Untagged Membership

The PT-7828 supports 802.1Q VLAN tagging, a system that allows traffic for multiple VLANs to be carried on a single physical (backbone, trunk) link. When setting up VLANs you need to understand when to use untagged and tagged membership of VLANs. Simply put, if a port is on a single VLAN it can be an untagged member, but if the port needs to be a member of multiple VLANs, tagged membership must be defined.

A typical host (e.g., clients) will be untagged members of one VLAN, defined as **Access Port** in PT-7828, while inter-switch connections will be tagged members of all VLANs, defined as **Trunk Port** in PT-7828.

The IEEE Std 802.1Q-1998 defines how VLANs operate within an open packet-switched network. An 802.1Q compliant packet carries additional information that allows a switch to determine which VLAN the port belongs to. If a frame is carrying the additional information, it is known as a *tagged* frame.

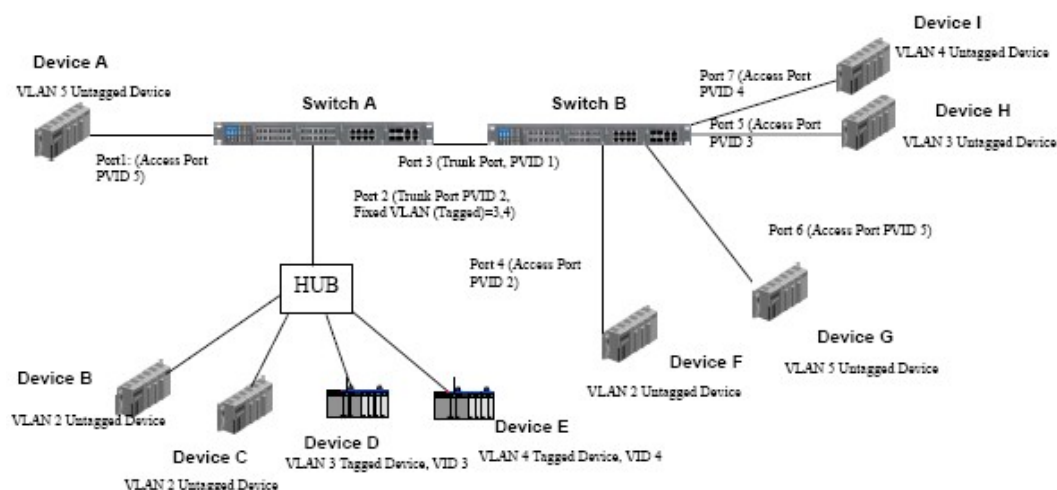

To carry multiple VLANs across a single physical (backbone, trunk) link, each packet must be tagged with a VLAN identifier so that the switches can identify which packets belong in which VLAN. To communicate between VLANs, a router must be used.

The PT-7828 supports two types of VLAN port settings:

- **Access Port:** The port connects to a single device that is not tagged. The user must define the default port PVID that assigns which VLAN the device belongs to. Once the ingress packet of this Access Port egresses to another Trunk Port (the port nePT all packets to carry tag information), PT-7828 will insert this PVID into this packet to help the next 802.1Q VLAN switch recognize it.
- **Trunk Port:** The port connects to a LAN that consists of untagged devices/tagged devices and/or switches and hubs. In general, the traffic of the Trunk Port must have a Tag. Users can also assign PVID to a Trunk Port. The untagged packet on the Trunk Port will be assigned the port default PVID as its VID.

The following section illustrates how to use these ports to set up different applications.

## Sample Applications of VLANs using PT-7828

In this application,

- Port 1 connects a single untagged device and assigns it to VLAN 5; it should be configured as **Access Port** with PVID 5.
- Port 2 connects a LAN with two untagged devices belonging to VLAN 2. One tagged device with VID 3 and one tagged device with VID 4. It should be configured as **Trunk Port** with PVID 2 for untagged device and Fixed VLAN (Tagged) with 3 and 4 for tagged device. Since each port can only have one unique PVID, all untagged devices on the same port can only belong to the same VLAN.
- Port 3 connects with another switch. It should be configured as **Trunk Port** GVRP protocol will be used through the Trunk Port.
- Port 4 connects a single untagged device and assigns it to VLAN 2; it should be configured as **Access Port** with PVID 2.
- Port 5 connects a single untagged device and assigns it to VLAN 3; it should be configured as **Access Port** with PVID 3.
- Port 6 connect a single untagged device and assigns it to VLAN 5; it should be configured as Access Port with PVID 5.
- Port 7 connects a single untagged device and assigns it to VLAN 4; it should be configured as **Access Port** with PVID 4.

After proper configuration:

- Packets from Device A will travel through **Trunk Port 3** with tagged VID 5. Switch B will recognize its VLAN, pass it to port 6, and then remove tags received successfully by Device G, and vice versa.
- Packets from Devices B and C will travel through **Trunk Port 3** with tagged VID 2. Switch B recognizes its VLAN, passes it to port 4, and then removes tags received successfully by Device F, and vice versa.
- Packets from Device D will travel through **Trunk Port 3** with tagged VID 3. Switch B will recognize its VLAN, pass to port 5, and then remove tags received successfully by Device H. Packets from Device H will travel through **Trunk Port 3** with PVID 3. Switch A will recognize its VLAN and pass it to port 2, but will not remove tags received successfully by Device D.
- Packets from Device E will travel through **Trunk Port 3** with tagged VID 4. Switch B will recognize its VLAN, pass it to port 7, and then remove tags received successfully by Device I. Packets from Device I will travel through **Trunk Port 3** with tagged VID 4. Switch A will recognize its VLAN and pass it to port 2, but will not remove tags received successfully by Device E.

## Configuring Virtual LAN

### VLAN Settings

To configure **802.1Q VLAN** on the PT-7828, use the VLAN Setting page to configure the ports.

**VLAN Port Setting**

Management VLAN ID:

| Port | Type   | PVID | Fixed VLAN (Tagged) | Forbidden VLAN |
|------|--------|------|---------------------|----------------|
| 1-1  | Access | 1    |                     |                |
| 1-2  | Access | 1    |                     |                |
| 1-3  | Access | 1    |                     |                |
| 1-4  | Access | 1    |                     |                |
| 1-5  | Access | 1    |                     |                |
| 1-6  | Access | 1    |                     |                |
| 4-1  | Access | 1    |                     |                |
| 4-2  | Access | 1    |                     |                |
| 4-3  | Access | 1    |                     |                |
| 4-4  | Access | 1    |                     |                |

**Activate**

#### Management VLAN ID

| Setting                | Description                               | Factory Default |
|------------------------|---|-----------------|
| VLAN ID from 1 to 4094 | This assigns the VLAN ID of this PT-7828. | 1               |

#### Port Type

| Setting | Description   | Factory Default |
|---------|---|-----------------|
| Access  | This port type is used to connect single devices without tags.  | Access          |
| Trunk   | Select <b>Trunk</b> port type to connect another 802.1Q VLAN aware switch or another LAN that combines tagged and/or untagged devices and/or other switches/hubs. |                 |

#### ATTENTION

For communication redundancy in the VLAN environment, set **Redundant Port Coupling Port** and **Coupling Control Port** as **Trunk Port** since these ports act as the **backbone** to transmit all packets of different VLANs to different PT-7828 units.

#### Port PVID

| Setting                  | Description  | Factory Default |
|--------------------------|--|-----------------|
| VID range from 1 to 4094 | This sets the default VLAN ID for untagged devices that connect to the port. | 1               |

*Fixed VLAN List (Tagged)*

| Setting                  | Description   | Factory Default |
|--------------------------|---|-----------------|
| VID range from 1 to 4094 | This field will be active only when selecting the <b>Trunk</b> port type. Set the other VLAN ID for tagged devices that connect to the Trunk port. Use commas to separate different VIDs. | None            |

*Forbidden VLAN List*

| Setting                  | Description  | Factory Default |
|--------------------------|--|-----------------|
| VID range from 1 to 4094 | This field will be active only when selecting the <b>Trunk</b> port type. Set the VLAN IDs that will not be supported by this trunk port. Use commas to separate different VIDs. | None            |

**VLAN Table**

| <b>VLAN Mode</b>                |     |   |                   |
|---------------------------------|-----|---|-------------------|
| VLAN Mode                       |     | 802.1Q VLAN                                       |                   |
| <b>Management VLAN</b>          |     |   |                   |
| Management VLAN                 |     | 1   |                   |
| <b>Current 802.1Q VLAN List</b> |     |   |                   |
| Index                           | VID | Joined Access Port                                | Joined Trunk Port |
| 1                               | 1   | 1-1, 1-2, 1-3, 1-4, 1-5, 1-6, 4-1, 4-2, 4-3, 4-4, |                   |

In 802.1Q VLAN table, you can review the VLAN groups that were created, Joined Access Ports, and Trunk Ports, and in Port-based VLAN table, you can review the VLAN group and Joined port.

**NOTE** The physical network can have a maximum of 64 VLAN settings.

## Using Multicast Filtering

Multicast filtering improves the performance of networks that carry multicast traffic. This section explains multicasts, multicast filtering, and how multicast filtering can be implemented on your PT-7828.

### The Concept of Multicast Filtering

#### What is an IP Multicast?

A *multicast* is a packet sent by one host to multiple hosts. Only those hosts that belong to a specific multicast group will receive the multicast. If the network is set up correctly, a multicast can only be sent to an end-station or a subset of end-stations on a LAN or VLAN that belong to the multicast group. Multicast group members can be distributed across multiple subnets, so that multicast transmissions can occur within a campus LAN or over a WAN. In addition, networks that support IP multicast send only *one* copy of the desired information across the network until the delivery path that reaches group members diverges. To make more efficient use of network bandwidth, it is only at these points that multicast packets are duplicated and forwarded. A multicast packet has a multicast group address in the destination address field of the packet's IP header.

## Benefits of Multicast

The benefits of using IP multicast are that it:

- Uses the most efficient, sensible method to deliver the same information to many receivers with only one transmission.
- Reduces the load on the source (for example, a server) since it will not need to produce several copies of the same data.
- Makes efficient use of network bandwidth and scales well as the number of multicast group members increases.
- Works with other IP protocols and services, such as Quality of Service (QoS).

Multicast transmission makes more sense and is more efficient than unicast transmission for some applications. For example, multicasts are often used for video-conferencing, since high volumes of traffic must be sent to several end-stations at the same time, but where broadcasting the traffic to all end-stations would cause a substantial reduction in network performance. Furthermore, several industrial automation protocols, such as Allen-Bradley, EtherNet/IP, Siemens Profibus, and Foundation Fieldbus HSE (High Speed Ethernet), use multicast. These industrial Ethernet protocols use publisher/subscriber communications models by multicasting packets that could flood a network with heavy traffic. IGMP Snooping is used to prune multicast traffic so that it travels only to those end destinations that require the traffic, reducing the amount of traffic on the Ethernet LAN.

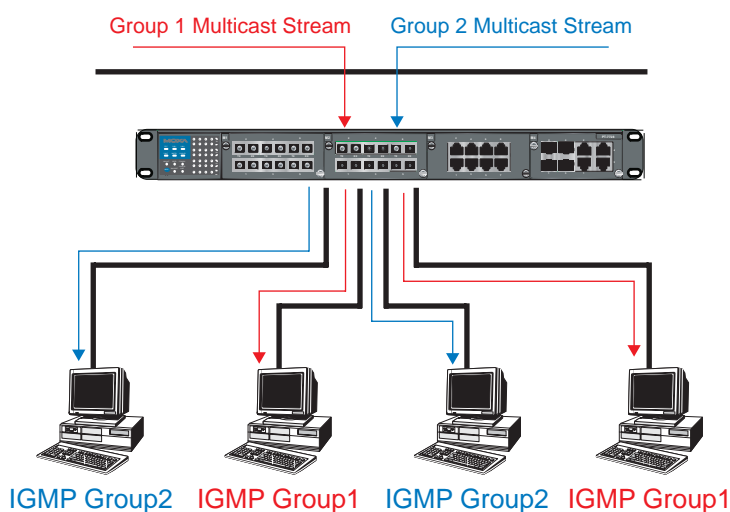

## Multicast Filtering

Multicast filtering ensures that only end-stations that have joined certain groups receive multicast traffic. With multicast filtering, network devices only forward multicast traffic to the ports that are connected to registered end-stations. The following two figures illustrate how a network behaves without multicast filtering, and with multicast filtering.

### Network without multicast filtering

All hosts receive the multicast traffic, even if they don't need it.

**Network with multicast filtering**

Hosts only receive dedicated traffic from other hosts belonging to the same group.

**Multicast Filtering and Moxa PowerTrans Switch**

The PT-7828 has three ways to achieve multicast filtering: IGMP (Internet Group Management Protocol) Snooping, GMRP (GARP Multicast Registration Protocol), and adding a static multicast MAC manually to filter multicast traffic automatically.

**IGMP (Internet Group Management Protocol)****Snooping Mode**

Snooping Mode allows your switch to forward multicast packets only to the appropriate ports. The switch **snoops** on exchanges between hosts and an IGMP device, such as a router, to find those ports that want to join a multicast group, and then configures its filters accordingly.

**Query Mode**

Query mode allows the PT-7828 to work as the Querier if it has the lowest IP address on the subnetwork to which it belongs. IGMP querying is enabled by default on the PT-7828 to help prevent interoperability issues with some multicast routers that may not follow the lowest IP address election method. Enable query mode to run multicast sessions on a network that does not contain IGMP routers (or queriers).

|      |   |
|------|---|
| NOTE | PT-7828 is compatible with any device that conforms to the IGMP v2 and IGMP v3 device protocol. |
|------|---|

## IGMP Multicast Filtering

IGMP is used by IP-supporting network devices to register hosts with multicast groups. It can be used on all LANs and VLANs that contain a multicast capable IP router, and on other network devices that support multicast filtering. IGMP works as follows:

1. The IP router (or querier) periodically sends *query* packets to all end-stations on the LANs or VLANs that are connected to it. For networks with more than one IP router, the router with the lowest IP address is the querier. A switch with IP address lower than the IP address of any other IGMP queriers connected to the LAN or VLAN can become the IGMP querier.
2. When an IP host receives a query packet, it sends a *report* packet back that identifies the multicast group that the end-station would like to join.
3. When the report packet arrives at a port on a switch with *IGMP Snooping* enabled, the switch knows that the port should forward traffic for the multicast group, and then proceeds to forward the packet to the router.
4. When the router receives the report packet, it registers that the LAN or VLAN requires traffic for the multicast groups.
5. When the router forwards traffic for the multicast group to the LAN or VLAN, the switches only forward the traffic to ports that received a report packet.

## GMRP (GARP Multicast Registration Protocol)

The PT-7828 supports IEEE 802.1D-1998 GMRP (GARP Multicast Registration Protocol), which differs from IGMP (Internet Group Management Protocol). GMRP is a MAC-based multicast management protocol, whereas IGMP is IP-based. GMRP provides a mechanism that allows bridges and end stations to register or de-register Group membership information dynamically. GMRP functions similarly to GVRP, except that GMRP registers multicast addresses on ports. When a port receives a **GMRP-join** message, it will register the multicast address to its database if the multicast address is not registered, and all the multicast packets with that multicast address are able to be forwarded from this port. When a port receives a **GMRP-leave** message, it will de-register the multicast address from its database, and all the multicast packets with this multicast address are not able to be forwarded from this port.

## Static Multicast MAC

Some devices may only support multicast packets, but not support either IGMP Snooping or GMRP. The PT-7828 supports adding multicast groups manually to enable multicast filtering.

## Enabling Multicast Filtering

Use the serial console or Web interface to enable or disable IGMP Snooping and IGMP querying. If IGMP Snooping is not enabled, then IP multicast traffic is always forwarded, flooding the network.

## Configuring IGMP Snooping

IGMP Snooping provides the ability to prune multicast traffic so that it travels only to those end destinations that require that traffic, thereby reducing the amount of traffic on the Ethernet LAN.

## IGMP Snooping Settings

**IGMP Snooping Setting**  
Current VLAN List

IGMP Snooping Enable ☐ Query Interval 125 (s)

| Index | VID | IGMP Snooping                              | Querier                                    | Static Multicast Querier Port   |
|-------|-----|--|--|---|
| 1     | 1   | <input checked="" type="checkbox"/> Enable | <input checked="" type="checkbox"/> Enable | <input type="checkbox"/> 1-1 <input type="checkbox"/> 1-2 <input type="checkbox"/> 1-3 <input type="checkbox"/> 1-4 <input type="checkbox"/> 1-5 <input type="checkbox"/> 1-6 <input type="checkbox"/> 4-1 <input type="checkbox"/> 4-2 <input type="checkbox"/> 4-3 <input type="checkbox"/> 4-4 |

Activate

### *IGMP Snooping Enable*

| Setting        | Description   | Factory Default |
|----------------|---|-----------------|
| Enable/Disable | Click the checkbox to enable the IGMP Snooping function <b>globally</b> . | Disabled        |

### *Query Interval*

| Setting                       | Description   | Factory Default |
|-------------------------------|---|-----------------|
| Numerical value input by user | This sets the query interval of the Querier function globally. Valid settings are from 20 to 600 seconds. | 125 seconds     |

### *IGMP Snooping*

| Setting        | Description   | Factory Default                           |
|----------------|---|---|
| Enable/Disable | This enables or disables the IGMP Snooping function per VLAN. | Enabled if IGMP Snooping Enabled Globally |

### *Querier*

| Setting        | Description  | Factory Default                              |
|----------------|--|--|
| Enable/Disable | This enables or disables the PT-7828's querier function. | Enabled if IGMP Snooping is Enabled Globally |

### *Static Multicast Router Port*

| Setting         | Description   | Factory Default |
|-----------------|---|-----------------|
| Select/Deselect | This selects the ports that will connect to the multicast routers. It is active only when IGMP Snooping is enabled. | Disabled        |

**NOTE** At least one switch must be designated the Querier or enable IGMP snooping and GMRP when enabling Turbo Ring and IGMP snooping simultaneously.

**IGMP Table**

The PT-7828 displays the current active IGMP groups that were detected.

| Current Active IGMP Groups |                                     |                               |                        |                |                    |                   |              |
|----------------------------|-------------------------------------|-------------------------------|------------------------|----------------|--------------------|-------------------|--------------|
| VID                        | Auto Learned Multicast Querier Port | Static Multicast Querier Port | Querier Connected Port | Act as Querier | Active IGMP Groups |                   |              |
|                            |                                     |                               |                        |                | IP                 | MAC               | Members Port |
| 1                          |                                     | 1-4                           |                        | Yes            | 239.255.255.250    | 01-00-5E-7F-FF-FA | 4-4          |

The information includes **VID**, **Auto-learned Multicast Router Port**, **Static Multicast Router Port**, **Querier Connected Port**, and the **IP** and **MAC** addresses of active IGMP groups.

## Add Static Multicast MAC

If required, the PT-7828 also supports adding multicast groups manually.

| Setting         | Description  | Factory Default |
|-----------------|--|-----------------|
| Select/Deselect | Checkmark the appropriate check boxes to select the join ports for this multicast group. | None            |

## Configuring GMRP

GMRP is a MAC-based multicast management protocol, whereas IGMP is IP-based. GMRP provides a mechanism that allows bridges and end stations to register or un-register Group membership information dynamically.

| Port | GMRP                            |
|------|---------------------------------|
| 1-1  | <input type="checkbox"/> Enable |
| 1-2  | <input type="checkbox"/> Enable |
| 1-3  | <input type="checkbox"/> Enable |
| 1-4  | <input type="checkbox"/> Enable |
| 1-5  | <input type="checkbox"/> Enable |
| 1-6  | <input type="checkbox"/> Enable |
| 4-1  | <input type="checkbox"/> Enable |
| 4-2  | <input type="checkbox"/> Enable |
| 4-3  | <input type="checkbox"/> Enable |
| 4-4  | <input type="checkbox"/> Enable |

**Activate**

### *GMRP enable*

| Setting        | Description   | Factory Default |
|----------------|---|-----------------|
| Enable/Disable | This enables or disables the GMRP function for the port listed in the Port column | Disable         |

## GMRP Table

The PT-7828 displays the current active GMRP groups that were detected

|   | Multicast Address | Fixed Ports | Learned Ports |
|---|-------------------|-------------|---------------|
| 1 | 01-00-5E-00-00-01 | 1-6,        |               |

| Setting       | Description  |
|---------------|--|
| Fixed Ports   | This multicast address is defined by static multicast. |
| Learned Ports | This multicast address is learned by GMRP.             |

## Using Bandwidth Management

In general, one host should not be allowed to occupy unlimited bandwidth, particularly when the device malfunctions. For example, so-called “broadcast storms” could be caused by an incorrectly configured topology, or a malfunctioning device. The PT-7828 not only prevents broadcast storms, but can also be configured to a different ingress rate for all packets, giving administrators full control of their limited bandwidth to prevent undesirable effects caused by unpredictable faults.

## Configuring Bandwidth Management

### Broadcast Storm Protection

**Broadcast Storm Protection**

☒ Broadcast Storm Protection

| 4-3  | Not Limited |
| 4-4  | Not Limited |

**Activate**

#### *Ingress*

| Setting      | Description  | Factory Default |
|--------------|--|-----------------|
| Ingress rate | Select the ingress rate for all packets from the following options: not limited, 3%, 5%, 10%, 15%, 25%, 35%, 50%, 65%, 85% | N/A             |

## Using Port Access Control

The PT-7828 provides two kinds of Port-Base Access Control. One is Static Port Lock and the other is IEEE 802.1X.

### Static Port Lock

The PT-7828 can also be configured to protect static MAC addresses for a specific port. With the Port Lock function, these locked ports will not learn any additional addresses, but only allow traffic from preset static MAC addresses, helping to block hackers and careless usage.

### IEEE 802.1X

The IEEE 802.1X standard defines a protocol for client/server-based access control and authentication. The protocol restricts unauthorized clients from connecting to a LAN through ports that are open to the Internet, and which otherwise would be readily accessible. The purpose of the authentication server is to check each client that requests access to the port. The client is only allowed access to the port if the client's permission is authenticated.

### The IEEE 802.1X Concept

Three components are used to create an authentication mechanism based on 802.1X standards: Client/Supplicant, Authentication Server, and Authenticator.

**Supplicant:** The end station that requests access to the LAN and switch services and responds to the requests from the switch.

**Authentication server:** The server that performs the actual authentication of the supplicant.

**Authenticator:** Edge switch or wireless access point that acts as a proxy between the supplicant and the authentication server, requesting identity information from the supplicant, verifying the information with the authentication server, and relaying a response to the supplicant.

The PT-7828 acts as an authenticator in the 802.1X environment. A supplicant and an authenticator exchange EAPOL (Extensible Authentication Protocol over LAN) frames with each other. We can either use an external RADIUS server as the authentication server, or implement the authentication server in PT-7828 by using a Local User Database as the authentication look-up table. When we use an external RADIUS server as the authentication server, the authenticator and the authentication server exchange EAP frames between each other.

Authentication can be initiated either by the supplicant or the authenticator. When the supplicant initiates the authentication process, it sends an **EAPOL-Start** frame to the authenticator. When the authenticator initiates the authentication process or when it receives an **EAPOL Start** frame, it sends an **EAP Request/Identity** frame to ask for the username of the supplicant.

## Configuring Static Port Lock

The PT-7828 supports adding unicast groups manually if required.

**Add Static Unicast MAC Address**

MAC Address

Port

**Activate**

| Setting     | Description  | Factory Default |
|-------------|--|-----------------|
| MAC Address | Add the static unicast MAC address into the address table. | None            |
| Port        | Fix the static address with a dedicated port.              | 1-1             |

## Configuring IEEE 802.1X

### Database Option

| Setting                  | Description   | Factory Default |
|--------------------------|---|-----------------|
| Local<br>(Max. 32 users) | Select this option when setting the Local User Database as the authentication database.   | Local           |
| Radius                   | Select this option to set an external RADIUS server as the authentication database. The authentication mechanism is <b>EAP-MD5</b> .  | Local           |
| Radius, Local            | Select this option to make using an external RADIUS server as the authentication database the first priority. The authentication mechanism is <b>EAP-MD5</b> . The first priority is to set the Local User Database as the authentication database. | Local           |

### Radius Server

| Setting                   | Description  | Factory Default |
|---------------------------|--|-----------------|
| IP address or domain name | The IP address or domain name of the RADIUS server | local host      |

### Server Port

| Setting   | Description                       | Factory Default |
|-----------|-----------------------------------|-----------------|
| Numerical | The UDP port of the RADIUS server | 1812            |

### Shared Key

| Setting                              | Description  | Factory Default |
|--------------------------------------|--|-----------------|
| alphanumeric<br>(Max. 40 characters) | A key to be shared between the external RADIUS server and PT-7828. Both ends must be configured to use the same key. | None            |

**Re-Auth**

| Setting        | Description  | Factory Default |
|----------------|--|-----------------|
| Enable/Disable | Select to require re-authentication of the client after a preset time period of no activity has elapsed. | Disable         |

**Re-Auth Period**

| Setting                         | Description   | Factory Default |
|---------------------------------|---|-----------------|
| Numerical<br>(60 to 65535 sec.) | Specify how frequently the end stations need to reenter usernames and passwords in order to stay connected. | 3600            |

**802.1X**

| Setting        | Description  | Factory Default |
|----------------|--|-----------------|
| Enable/Disable | Click the checkbox under the 802.1X column to enable IEEE 802.1X for one or more ports. All end stations must enter usernames and passwords before access to these ports is allowed. | Disable         |

**802.1X Re-Authentication**

The PT-7828 can force connected devices to be re-authorized manually.

**802.1X Re-Authentication**

| Port | 802.1X                                   |
|------|--|
| 4-1  | <input type="checkbox"/> Re-Authenticate |
| 4-2  | <input type="checkbox"/> Re-Authenticate |

**802.1X Re-Authentication**

| Setting        | Description                                       | Factory Default |
|----------------|---|-----------------|
| Enable/Disable | This enables or disables 802.1X Re-Authentication | Disable         |

**Local User Database Setup**

When setting the Local User Database as the authentication database, set the database first.

**Local User Database Setup****Current Local Database**

|                                     |       |           |          |             |

|------------|-------|-------------|--------|
|------------|-------|-------------|--------|

Remove Select

The port status will show authorized or unauthorized.

## Using IP Filter

IP filtering lets users control which IP addresses are allowed to access the port.

The screenshot shows the 'IP Filter' configuration page. At the top, there is a 'Port' dropdown menu currently set to '1-1'. Below this is a table with two columns: 'Index' and 'IP Address'. The table has 8 rows, indexed 1 through 8. Each row has a corresponding text input field for the IP address. At the bottom right of the table area is a green 'Activate' button.

| Index | IP Address           |
|-------|----------------------|
| 1     | <input type="text"/> |
| 2     | <input type="text"/> |
| 3     | <input type="text"/> |
| 4     | <input type="text"/> |
| 5     | <input type="text"/> |
| 6     | <input type="text"/> |
| 7     | <input type="text"/> |
| 8     | <input type="text"/> |

**Activate**

## Using Auto Warning

Since industrial Ethernet devices are often located at the endpoints of a system, these devices will not always know what is happening elsewhere on the network. This means that an industrial Ethernet switch that connects to these devices must provide system maintainers with real-time alarm messages. Even when control engineers are out of the control room for an extended period of time, they can still be informed of the status of devices almost instantaneously when exceptions occur. The PT-7828 supports different approaches to warn engineers automatically, such as email and relay output. It also supports two digital inputs to integrate sensors into your system to automate alarms by email and relay output.

## Configuring Email Warning

The Auto Email Warning function uses e-mail to alert the user when certain user-configured events take place.

Three basic steps are required to set up the Auto Warning function:

1. **Configuring Email Event Types**  
Select the desired **Event types** from the Console or Web Browser Event type page (a description of each event type is given later in the *Email Alarm Events setting* subsection).
2. **Configuring Email Settings**  
To configure PT-7828's email setup from the serial, Telnet, or web console, enter your Mail Server IP/Name (IP address or name), Account Name, Account Password, Retype New Password, and the email address to which warning messages will be sent.
3. **Activate your settings and if necessary, test the email**  
After configuring and activating your PT-7828's Event Types and Email Setup, you can use the **Test Email** function to see if your e-mail addresses and mail server address have been properly configured.

## Event Type

**Port Events**

| Port | Link-ON                  | Link-OFF                 | Traffic-Overload         | Traffic-Threshold(%) | Traffic-Duration(s) |
|------|--------------------------|--------------------------|--------------------------|----------------------|---------------------|
| 1-1  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 0                    | 1                   |
| 1-2  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 0                    | 1                   |
| 1-3  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 0                    | 1                   |
| 1-4  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 0                    | 1                   |
| 1-5  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 0                    | 1                   |
| 1-6  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 0                    | 1                   |
| 4-1  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 0                    | 1                   |
| 4-2  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 0                    | 1                   |

**Activate**

Event Types can be divided into two basic groups: **System Events** and **Port Events**. System Events are related to the overall function of the switch, whereas Port Events are related to the activity of a specific port.

| System Events                     | Warning e-mail is sent when...   |
|-----------------------------------|--|
| Switch Cold Start                 | Power is cut off and then reconnected.   |
| Switch Warm Start                 | PT-7828 is rebooted, such as when network parameters are changed (IP address, subnet mask, etc.).  |
| Power Transition (On→Off)         | PT-7828 is powered down.   |
| Power Transition (Off→On)         | PT-7828 is powered up.   |
| Configuration Change Activated    | Any configuration item has been changed.   |
| Authentication Failure            | An incorrect password is entered.  |
| Comm. Redundancy Topology Changed | If any Spanning Tree Protocol switches have changed their position (applies only to the root of the tree).<br>If the Master of the Turbo Ring has changed or the backup path is activated. |

| Port Events             | Warning e-mail is sent when...  |
|-------------------------|---|
| Link-ON                 | The port is connected to another device.  |
| Link-OFF                | The port is disconnected (e.g., the cable is pulled out, or the opposing device shuts down).  |
| Traffic-Overload        | The port's traffic surpasses the Traffic-Threshold for that port (provided this item is Enabled).   |
| Traffic-Threshold (%)   | Enter a nonzero number if the port's Traffic-Overload item is Enabled.  |
| Traffic-Duration (sec.) | A Traffic-Overload warning is sent every <i>Traffic-Duration</i> seconds if the average Traffic-Threshold is surpassed during that time period. |

NOTE The **Traffic-Overload**, **Traffic-Threshold (%)**, and **Traffic-Duration (sec.)** Port Event items are related. If you Enable the Traffic-Overload event, then be sure to enter a nonzero Traffic-Threshold percentage, as well as a Traffic-Duration between 1 and 300 seconds.

NOTE Warning e-mail messages will have **sender** given in the form:  
**Moxa\_PowerTrans\_Switch\_0001@Switch\_Location**  
 where **Moxa\_PowerTrans\_Switch** is the default Switch Name, **0001** is PT-7828's serial number, and **Switch\_Location** is the default Server Location.  
 Refer to the **Basic Settings** section to see how to modify **Switch Name** and **Switch Location**.

## Email Setup

### Mail Server IP/Name

| Setting    | Description                          | Factory Default |
|------------|--------------------------------------|-----------------|
| IP address | The IP Address of your email server. | None            |

### Account Name

| Setting          | Description         | Factory Default |
|------------------|---------------------|-----------------|
| Max. 45 Charters | Your email account. | None            |

### Password Setting

| Setting                           | Description  | Factory Default |
|-----------------------------------|--|-----------------|
| Disable/Enable to change password | To reset the password from the Web Browser interface, click the Change password check-box, type the Old password, type the New password, retype the New password, and then click Activate; Max. 45 characters. | Disable         |
| Old password                      | Type the current password when changing the password   | None            |
| New password                      | Type new password when enabled to change password; Max. 45 characters.   | None            |
| Retype password                   | If you type a new password in the Password field, you  | None            |

|  |  |  |
|--|--|--|
|  | will be required to retype the password in the Retype new password field before updating the new password. |  |
|--|--|--|

**Email Address**

| Setting            | Description   | Factory Default |
|--------------------|---|-----------------|
| Max. 30 characters | You can set up to 4 email addresses to receive alarm emails from PT-7828. | None            |

**Send Test Email**

After finishing with the email settings, you should first click **Activate** to activate those settings, and then press the **Send Test Email** button to verify that the settings are correct.

**NOTE** Auto warning e-mail messages will be sent through an authentication protected SMTP server that supports the CRAM-MD5, LOGIN, and PAIN methods of SASL (Simple Authentication and Security Layer) authentication mechanism.

We strongly recommend not entering your Account Name and Account Password if auto warning e-mail messages can be delivered without using an authentication mechanism.

## Configuring Relay Warning

The Auto Relay Warning function uses relay output to alert the user when certain user-configured events take place. There are two basic steps required to set up the Relay Warning function:

1. **Configuring Relay Event Types**  
Select the desired **Event types** from the Console or Web Browser Event type page (a description of each event type is given later in the *Relay Alarm Events setting* subsection).
2. **Activate your settings**  
After completing the configuration procedure, you will need to activate your PT-7828's Relay Event Types.

## Event Setup

**Relay Warning Events Settings**

**System Events**

☐ Override Relay 1 Warning Settings

Power Input 1 failure(On->Off) Disable Power Input 2 failure(On->Off) Disable

Turbo Ring Break Disable

**Port Events**

| Port | Link                | Traffic-Overload     | Traffic-Threshold(%)           | Traffic-Duration(s)            |
|------|---------------------|----------------------|--------------------------------|--------------------------------|
| 1-1  | <span>Ignore</span> | <span>Disable</span> | <input type="text" value="1"/> | <input type="text" value="1"/> |
| 1-2  | <span>Ignore</span> | <span>Disable</span> | <input type="text" value="1"/> | <input type="text" value="1"/> |
| 1-3  | <span>Ignore</span> | <span>Disable</span> | <input type="text" value="1"/> | <input type="text" value="1"/> |
| 1-4  | <span>Ignore</span> | <span>Disable</span> | <input type="text" value="1"/> | <input type="text" value="1"/> |
| 1-5  | <span>Ignore</span> | <span>Disable</span> | <input type="text" value="1"/> | <input type="text" value="1"/> |
| 1-6  | <span>Ignore</span> | <span>Disable</span> | <input type="text" value="1"/> | <input type="text" value="1"/> |
| 4-1  | <span>Ignore</span> | <span>Disable</span> | <input type="text" value="1"/> | <input type="text" value="1"/> |
| 4-2  | <span>Ignore</span> | <span>Disable</span> | <input type="text" value="1"/> | <input type="text" value="1"/> |

Activate

Event Types can be divided into two basic groups: **System Events** and **Port Events**. System Events are related to the overall function of the switch, whereas Port Events are related to the activity of a specific port.

The PT-7828 supports two relay outputs. You can configure which relay output is related to which events. This helps administrators identify the importance of the different events.

| System Events             | Warning Relay output is triggered when... |
|---------------------------|---|
| Power Transition (On→Off) | PT-7828 is powered on.                    |
| Power Transition (Off→On) | PT-7828 is powered down.                  |

| Port Events             | Warning e-mail is sent when...  |
|-------------------------|---|
| Link-ON                 | The port is connected to another device.  |
| Link-OFF                | The port is disconnected (e.g., the cable is pulled out, or the opposing device shuts down).  |
| Traffic-Overload        | The port's traffic surpasses the Traffic-Threshold for that port (provided this item is Enabled).   |
| Traffic-Threshold (%)   | Enter a nonzero number if the port's Traffic-Overload item is Enabled.  |
| Traffic-Duration (sec.) | A Traffic-Overload warning is sent every <i>Traffic-Duration</i> seconds if the average Traffic-Threshold is surpassed during that time period. |

**NOTE** The **Traffic-Overload**, **Traffic-Threshold (%)**, and **Traffic-Duration (sec)** Port Event items are related. If you Enable the Traffic-Overload event, then be sure to enter a nonzero Traffic-Threshold percentage, as well as a Traffic-Duration between 1 and 300 seconds.

### Override relay alarm settings

Click the checkbox to override the relay warning setting temporarily. Releasing the relay output will allow administrators to fix any problems with the warning condition.

### Warning List

Use this table to see if any relay alarms have been issued.

| Current Warning List |       |
|----------------------|-------|
| Index                | Event |
|                      |       |

### Using Line-Swap-Fast-Recovery

The Line-Swap Fast Recovery function, which is enabled by default, allows PT-7828 to return to normal operation extremely quickly after devices are unplugged and then re-plugged into different ports. The recovery time is on the order of a few milliseconds (compare this with standard commercial switches for which the recovery time could be on the order of several minutes). To disable the Line-Swap Fast Recovery function, or to re-enable the function after it has already been disabled, access either the Console utility's **Line-Swap recovery** page, or the Web Browser interface's **Line-Swap fast recovery** page, as shown below.

## Configuring Line-Swap Fast Recovery

### Enable Line-Swap-Fast-Recovery

| Setting        | Description   | Factory Default |
|----------------|---|-----------------|
| Enable/Disable | Check-mark the check box to enable the Line-Swap-Fast-Recovery function | Enable          |

## Using Set Device IP

To reduce the effort required to set up IP addresses, the PT-7828 comes equipped with DHCP/BootP server and RARP protocol to set up IP addresses of Ethernet-enabled devices automatically.

When enabled, the **Set device IP** function allows PT-7828 to assign specific IP addresses automatically to connected devices that are equipped with *DHCP Client* or *RARP* protocol. In effect, PT-7828 acts as a DHCP server by assigning a connected device with a specific IP address stored in its internal memory. Each time the connected device is switched on or rebooted, PT-7828 sends the device the desired IP address.

Take the following steps to use the **Set device IP** function:

### STEP 1—Set up the connected devices

Set up those Ethernet-enabled devices connected to PT-7828 for which you would like IP addresses to be assigned automatically. The devices must be configured to *obtain* their IP address automatically.

The devices' configuration utility should include a setup page that allows you to choose an option similar to **Obtain an IP address automatically**.

For example, Windows' **TCP/IP Properties** window is shown at the right. Although your device's configuration utility may look quite a bit different, this figure should give you some idea of what to look for.

You also need to decide which of PT-7828's ports your Ethernet-enabled devices will be connected to. You will need to set up each of these ports separately, as described in the following step.

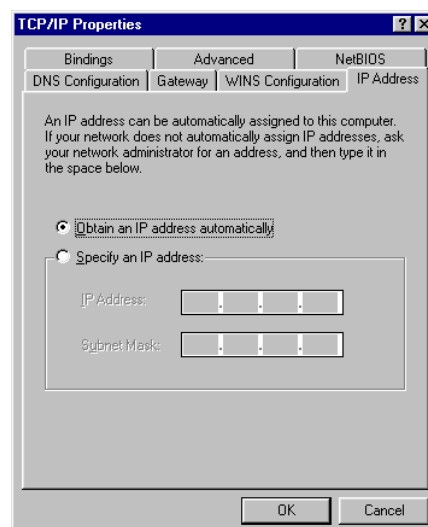

### STEP 2

Configure PT-7828's **Set device IP** function, either from the Console utility or from the Web Browser interface. In either case, you simply need to enter the **Desired IP** for each port that needs to be configured.

### STEP 3

Be sure to activate your settings before exiting.

- When using the Web Browser interface, activate by clicking on the Activate button.

- When using the Console utility, activate by first highlighting the **Activate** menu option, and then press **Enter**. You should receive the **Set device IP settings are now active! (Press any key to continue)** message.

## Configuring Set Device IP

**Automatic Set Device IP by DHCP/BootP/RARP**

| Port | Device's current IP | Active function | Desired IP address   |
|------|---------------------|-----------------|----------------------|
| 1-1  | NA                  | --              | <input type="text"/> |
| 1-2  | NA                  | --              | <input type="text"/> |
| 1-3  | NA                  | --              | <input type="text"/> |
| 1-4  | NA                  | --              | <input type="text"/> |
| 1-5  | NA                  | --              | <input type="text"/> |
| 1-6  | NA                  | --              | <input type="text"/> |
| 4-1  | NA                  | --              | <input type="text"/> |
| 4-2  | NA                  | --              | <input type="text"/> |
| 4-3  | NA                  | --              | <input type="text"/> |
| 4-4  | NA                  | --              | <input type="text"/> |

**Activate**

### *Desired IP Address*

| Setting    | Description                              | Factory Default |
|------------|--|-----------------|
| IP Address | Set the desired IP of connected devices. | None            |

## Using Diagnosis

The PT-7828 provides two important tools for administrators to diagnose network systems.

### Mirror Port

**Mirror Port Settings**

Monitored port

Watch direction

Mirror port

**Activate**

The **Mirror port** function can be used to monitor data being transmitted through a specific port. This is done by setting up another port (the *mirror port*) to receive the same data being transmitted from, or both to and from, the port under observation. This allows the network administrator to **sniff** the observed port and thus keep tabs on network activity.

Take the following steps to set up the **Mirror Port** function:

**STEP 1**

Configure PT-7828's **Mirror Port** function from either the Console utility or Web Browser interface. You will need to configure three settings:

|                        |  |
|------------------------|--|
| <b>Monitored Port</b>  | Select the port number of the port whose network activity will be monitored.   |
| <b>Mirror Port</b>     | Select the port number of the port that will be used to monitor the activity of the monitored port.  |
| <b>Watch Direction</b> | Select one of the following two watch direction options: <ul style="list-style-type: none"> <li>• <b>Output data stream</b><br/>Select this option to monitor only those data packets being sent <i>out through</i> PT-7828's port.</li> <li>• <b>Bi-directional</b><br/>Select this option to monitor data packets both coming <i>into</i>, and being sent <i>out through</i>, PT-7828's port.</li> </ul> |

**STEP 2**

Be sure to activate your settings before exiting.

- When using the Web Browser interface, activate by clicking on the **Activate** button.
- When using the Console utility, activate by first highlighting the Activate menu option, and then press **Enter**. You should receive the **Mirror port settings are now active! (Press any key to continue)** message.

## Ping

### Use Ping Command to test Network Integrity

IP address/Name

Ping

The **Ping** function uses the *ping* command to give users a simple but powerful tool for troubleshooting network problems. The function's most unique feature is that even though the ping command is entered from the user's PC keyboard, the actual ping command originates from PT-7828 itself. In this way, the user can essentially sit on top of PT-7828 and send ping commands out through its ports.

To use the Ping function, type in the desired IP address, and then press **Enter** from the Console utility, or click **Ping** when using the Web Browser interface.

## Using Monitor

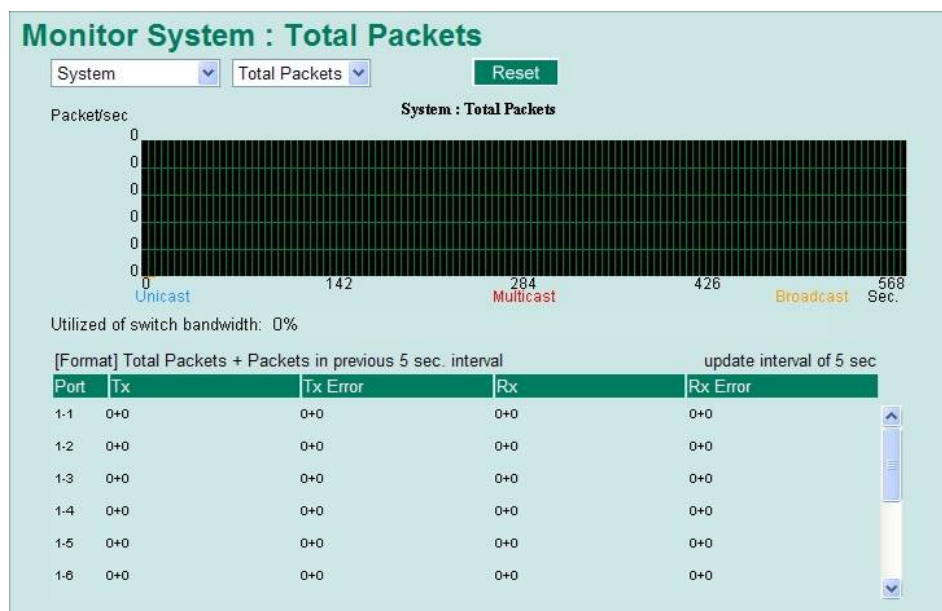

You can monitor statistics in real time from PT-7828's web console and serial console.

### Monitor by Switch

Access the Monitor by selecting **System** from the left selection bar. Monitor by System allows the user to view a graph that shows the combined data transmission activity of all of PT-7828's 18 ports. Click one of the four options—**Total Packets**, **TX Packets**, **RX Packets**, or **Error Packets**—to view transmission activity of specific types of packets. Recall that TX Packets are packets sent out from PT-7828, RX Packets are packets received from connected devices, and Error Packets are packets that did not pass TCP/IP's error checking algorithm. The Total Packets

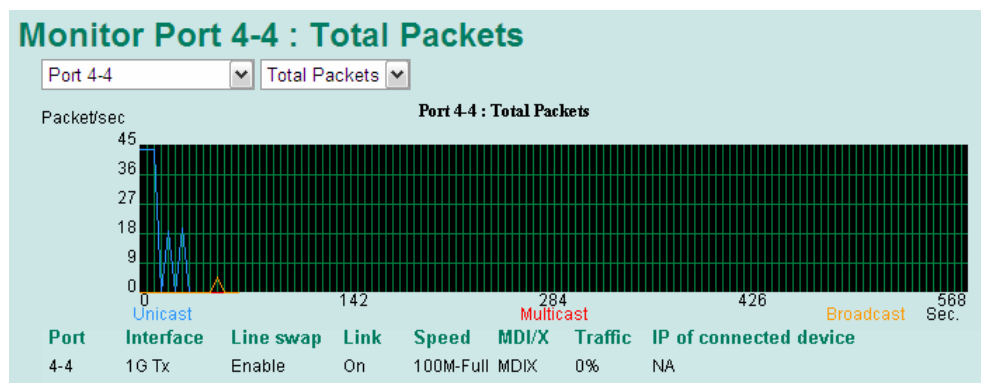

option displays a graph that combines TX, RX, and TX Error, RX Error Packets activity. The graph displays data transmission activity by showing **Packets/s** (i.e., packets per second, or pps) versus **sec.** (seconds). In fact, three curves are displayed on the same graph: **Uni-cast** packets (in red color), **Multi-cast** packets (in green color), and **Broad-cast** packets (in blue color). The graph is updated every few seconds, allowing the user to analyze data transmission activity in real-time.

## Monitor by Port

Access the Monitor by Port function by selecting **ALL 10/100M or 1G Ports** or **Port *i***, in which *i* = 1, 2, ..., G2, from the left pull-down list. The **Port *i*** options are identical to the Monitor by System function discussed above, in that users can view graphs that show All Packets, TX Packets, RX Packets, or Error Packets activity, but in this case, only for an individual port. The **All Ports** option is essentially a graphical display of the individual port activity that can be viewed with the Console Monitor function discussed above. The All Ports option shows three vertical bars for each port. The height of the bar represents **Packets/s** for the type of packet, at the instant the bar is being viewed. That is, as time progresses, the height of the bar moves up or down so that the user can view the change in the rate of packet transmission. The blue colored bar shows **Uni-cast** packets, the red colored bar shows **Multi-cast** packets, and the orange colored bar shows **Broad-cast** packets. The graph is updated every few seconds, allowing the user to analyze data transmission activity in real-time.

## Using the MAC Address Table

This section explains the information provided by PT-7828's MAC address table.

### All MAC Address List

All

Page 1/1

| Index | MAC               | Type     | VLAN | Port |
|-------|-------------------|----------|------|------|
| 1     | 00-a0-0c-c1-05-36 | ucast(l) | 1    | 4-2  |

The MAC Address table can be configured to display the following PT-7828 MAC address groups.

|                      |   |
|----------------------|---|
| ALL                  | Select this item to show all PT-7828 MAC addresses                                      |
| ALL Learned          | Select this item to show all PT-7828 Learned MAC addresses                              |
| ALL Static Lock      | Select this item to show all PT-7828 Static Lock MAC addresses                          |
| ALL Static           | Select this item to show all PT-7828 Static/Static Lock /Static Multicast MAC addresses |
| ALL Static Multicast | Select this item to show all PT-7828 Static Multicast MAC addresses                     |
| Port x               | Select this item to show all MAC addresses of dedicated ports                           |

The table will display the following information:

|      |  |
|------|--|
| MAC  | This field shows the MAC address                           |
| Type | This field shows the type of this MAC address              |
| Port | This field shows the port that this MAC address belongs to |

## Using Event Log

### Event Log Table

Page 2/2

| Index | Bootup | Date | Time | System Startup Time | Event                          |
|-------|--------|------|------|---------------------|--------------------------------|
| 16    | 49     | --   | --   | 0d0h0m21s           | Port 4-2 link on               |
| 17    | 49     | --   | --   | 0d0h11m52s          | Port 4-2 link off              |
| 18    | 49     | --   | --   | 0d0h14m14s          | Port 4-2 link on               |
| 19    | 49     | --   | --   | 0d0h14m44s          | Port 4-2 link off              |
| 20    | 49     | --   | --   | 0d0h14m46s          | Port 4-2 link on               |
| 21    | 49     | --   | --   | 0d0h19m46s          | 192.168.127.238 admin Auth. ok |
| 22    | 49     | --   | --   | 0d0h32m34s          | 192.168.127.238 admin Auth. ok |
| 23    | 49     | --   | --   | 0d0h51m16s          | Port 4-2 link off              |
| 24    | 49     | --   | --   | 0d14h58m47s         | Port 4-2 link on               |
| 25    | 49     | --   | --   | 0d14h59m17s         | Port 4-2 link off              |
| 26    | 49     | --   | --   | 0d14h59m19s         | Port 4-2 link on               |
| 27    | 49     | --   | --   | 0d15h7m35s          | 192.168.127.238 admin Auth. ok |

Clear

|                     |  |
|---------------------|--|
| Bootup              | This field shows how many times the PT-7828 has been rebooted or cold started.             |
| Date                | The date is updated based on how the current date is set in the <b>Basic Setting</b> page. |
| Time                | The time is updated based on how the current time is set in the <b>Basic Setting</b> page. |
| System Startup Time | The system startup time related to this event.   |
| Events              | Events that have occurred.   |

NOTE The following events will be record into PT-7828's Event Log Table.

- Cold start
- Warm start
- Configuration change activated
- Power 1/2 transition (Off → On), Power 1/2 transition (On → Off)
- Authentication fail
- Topology changed
- Master setting is mismatched
- Port traffic overload
- dot1x Auth Fail
- Port link off / on

## Using Syslog

This function provides the event logs for the syslog server. The function supports 3 configurable syslog servers and syslog server UDP port numbers. When an event occurs, the event will be sent as a syslog UDP packet to the specified syslog servers.

### Syslog Server 1

| Setting                          | Description   | Factory Default |
|----------------------------------|---|-----------------|
| IP Address                       | Enter the IP address of 1st Syslog server used by your network. | None            |
| Port Destination<br>(1 to 65535) | Enter the UDP port of 1st Syslog server.                        | 514             |

*Syslog Server 2*

| Setting                          | Description   | Factory Default |
|----------------------------------|---|-----------------|
| IP Address                       | Enter the IP address of 2nd Syslog server used by your network. | None            |
| Port Destination<br>(1 to 65535) | Enter the UDP port of 2nd Syslog server.                        | 514             |

*Syslog Server 3*

| Setting                          | Description   | Factory Default |
|----------------------------------|---|-----------------|
| IP Address                       | Enter the IP address of 3rd Syslog server used by your network. | None            |
| Port Destination<br>(1 to 65535) | Enter the UDP port of 3rd Syslog server.                        | 514             |

**NOTE** The following events will be recorded into the PT-7828's Event Log table, and will then be sent to the specified Syslog Server:

- Cold start
- Warm start
- Configuration change activated
- Power 1/2 transition (Off → On), Power 1/2 transition (On → Off)
- Authentication fail
- Topology changed
- Master setting is mismatched
- Port traffic overload
- dot1x Auth Fail
- Port link off / on

## Using HTTPS/SSL

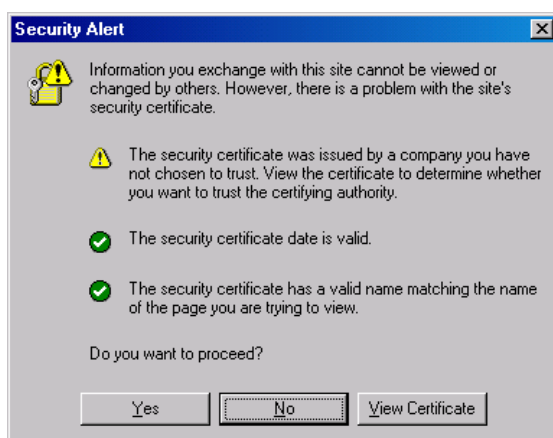

To secure your HTTP access, the PT-7828 supports HTTPS/SSL to encrypt all HTTP traffic. Perform the following steps to access the PT-7828's web browser interface via HTTPS/SSL.

1. Open Internet Explorer and type **https://PT-7828's IP address** in the address field. Press Enter to establish the connection.

2. Warning messages will pop out to warn the user that the security certificate was issued by a company they have not chosen to trust.

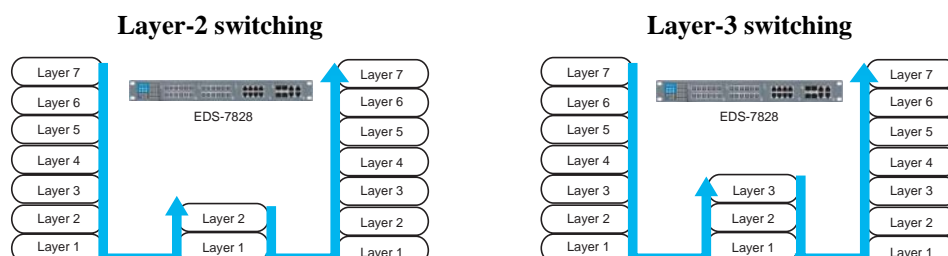

3. Select **Yes** to enter the PT-7828's web browser interface and access the web browser interface secured via HTTPS/SSL.

**NOTE** Moxa provides a Root CA certificate. After installing this certificate into your PC or Notebook, you can access the web browser interface directly and will not see any warning messages again. You may download the certificate from the PT-7828A's CD-ROM.

## Using Layer 3 Settings

The PT-7828 is a Layer-3 switch uses the Network Layer (layer 3) of the ISO's OSI layer model for data switching. Unlike Layer-2 switching for which the MAC address is used for exchanging data, a Layer-3 switch uses the IP address to determine the destination of a data packet.

## The Layer-3 Switching Concept

IP (Internet Protocol) is a protocol defined on layer 3 of the OSI 7-layer model. The IP address is used to address data packets on the Network Layer, and is not tied to the hardware of a device or PC. The IP address can be assigned by the system operator or network administrator.

Whereas a layer 2 switch uses the MAC address of a network card to determine the destination of data packets, a layer 3 switch uses IP address currently assigned to the network card to transmit data packets. Switches use ARP (Address Resolution Protocol) to establish the relationship between MAC addresses and IP addresses.

When a PC sends out an ARP request, which is a broadcast packet requiring the IP address owner to send back his MAC address, one of two situations could be encountered:

- If your PC and the IP address owner are on the same subnet, the IP address owner will use a unicast packet, which contains his MAC address, to reply to your PC. Henceforth, your PC will use this MAC address to transmit to the IP address owner directly.
- If your PC and the IP address owner are not on the same subnet, your PC will not receive a reply, so it will ask for the MAC address of the Layer-3 switch (gateway/ router). To transmit data packets to IP address owner, your PC packs the data packet with IP address and sends this packet to the Layer-3 switch (gateway/ router) with its MAC address. The Layer-3 switch (gateway/ router) receives the data packet, and then repacks and forwards it to the next hop, based on the routing rules.

### Static Routing and Dynamic Routing

The PT-7828 supports both static and dynamic routing. Dynamic routing can use either RIP V1 and/or V2. You can either choose one of the routing methods, or combine the two methods to establish your routing table.

A routing entry includes the following items: the destination address, the next hop address (which is the next router along the path to the destination address), and the metric that gives the cost we have to pay to access a different network.

### Static Routing

You can define the routes yourself by specifying the next hop (or router) that PT-7828 should forward data to for a specific subnet. The Static Route settings will be stored in the PT-7828's routing table.

### RIP (Routing Information Protocol)

RIP is a distance vector-based routing protocol that can automatically build up a routing table in the PT-7828.

The PT-7828 can efficiently update and maintain the routing table and optimize the routing with the smallest metric and most matched mask prefix.

## Interface Setting

The IP Interface Setting page is used to assign the interface.

**IP Interface Setting**

**IP Interface Entry**

Interface Name: IF\_1

IP Address: 100.10.1.1

Subnet Mask: 255.255.255.0

VLAN ID: 2

Proxy ARP: ☐ Enable

**Buttons:** Add, Delete, Modify

**IP Interface Table**

|                          | Interface Name | IP Address | Subnet Mask   | VLAN ID | Proxy ARP |
|--------------------------|----------------|------------|---------------|---------|-----------|
| <input type="checkbox"/> | IF_1           | 100.10.1.1 | 255.255.255.0 | 2       | Disabled  |

**Buttons:** Activate

**Interface Name**

Use this option to describe this interface (Max. of 30 characters).

**IP Address**

Use this option to specify the IP address of this interface.

**Subnet Mask**

Use this option to specify the subnet mask for this IP address.

**VLAN ID**

| Setting    | Description   | Factory Default                   |
|------------|---|-----------------------------------|
| ID numbers | Display all available VLAN ID that you have set in <i>Virtual LAN</i> . To establish a interface, you have to assign an available ID for this interface firstly. If a VLAN ID is assigned twice, a warning message will be shown. | None (if no VLAN ID is available) |

**Proxy ARP**

| Setting        | Description   | Factory Default |
|----------------|---|-----------------|
| Enable/Disable | This option is used to enable or disable the function of Proxy ARP. | Disabled        |

There are three action buttons for setting up the IP Interface Table:

**Add**

For adding an entry into the IP Interface Table.

**Delete**

For removing the selected entries in the IP Interface Table.

**Modify**

For modifying the content of a selected entry in the IP Interface Table.

|      |   |
|------|---|
| NOTE | The entries in the IP Interface Table will not be added into the PT-7828's interface table until you click the Activate button. |
|------|---|

## RIP

The RIP page is used to set up the RIP parameters.

**RIP Setting**

**RIP Enable**  
Choose if RIP will be enabled ☐

**RIP Version**  
RIP Send Version Choose  
☐ V1  
☐ V2  
☐ V1 Compatibility

**RIP Distribution**

☐ Static

**RIP Enable Table**

| Interface Name                          | IP | VID | Enable |
|---|----|-----|--------|
| <input type="button" value="Activate"/> |    |     |        |

### ***RIP Enable***

| Setting        | Description   | Factory Default |
|----------------|---|-----------------|
| Enable/Disable | This option is used to enable or disable the RIP function globally. | Disabled        |

### ***RIP Version***

You can specify which version the RIP should follow. You can also select V1 Compatibility to make sure that Version 1 PIP packets can also be received.

### ***RIP Distribution***

| Setting   | Description   | Factory Default                |
|-----------|---|--------------------------------|
| Connected | The entries that are learned from the connected ports will be re-distributed if this option is enabled. | <i>Unchecked</i><br>(disabled) |
| Static    | The entries that are set in a static route will be re-distributed if this option is enabled.            | <i>Unchecked</i><br>(disabled) |

### ***RIP Enable Table***

This is a table showing the entries learned from RIP.

**NOTE** The RIP settings will not function until you click the Activate button.

## Static Route

The Static Route page is used to set up the PT-7828's static routing table.

**Static Route**

**Static Route Entry**

Destination Address:

Netmask:

Next Hop:

Metric (1~255):

**Static Routing Table**

| <input checked="" type="checkbox"/> All | Destination Address | Netmask       | Next Hop     | Metric |
|---|---------------------|---------------|--------------|--------|
| <input type="checkbox"/>                | 100.10.1.1          | 255.255.255.0 | 100.10.1.254 | 10     |

### ***Destination Address***

Use this option to specify the destination's IP address.

### ***Subnet Mask***

Use this option to specify the subnet mask for this IP address.

### ***Next Hop***

Use this option to specify the next router along the path to the destination.

### ***Metric***

Use this option to specify the cost you must pay to access the neighboring network.

Three action buttons are available for setting up the Static Routing Table:

### ***Add***

Use this button to add an entry to the Static Routing Table

### ***Delete***

Use this button to remove the selected entries from the Static Routing Table

### ***Modify***

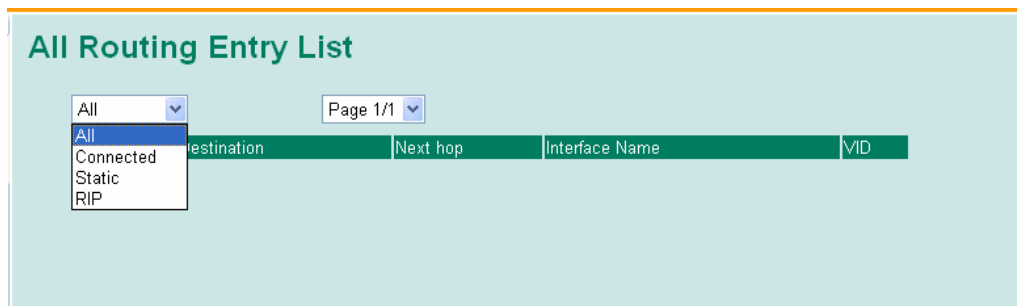

Use this option to modify the content of a selected entry in the Static Routing Table

|             |   |
|-------------|---|
| <b>NOTE</b> | The entries in the Static Route Table will not be added into the PT-7828's routing table until you click the Activate button. |
|-------------|---|

## Routing Table

The Routing Table page shows all routing entries that the PT-7828 is using.

## MIB Groups

---

The PT-7828 comes with built-in SNMP (Simple Network Management Protocol) agent software that supports cold/warm start trap, line up/down trap, and RFC 1213 MIB-II.

The standard MIB groups that the PT-7828 supports are as follows:

**MIB II.1 – System Group**

sysORTable

**MIB II.2 – Interfaces Group**

ifTable

**MIB II.4 – IP Group**

ipAddrTable

ipNetToMediaTable

IpGroup

IpBasicStatsGroup

IpStatsGroup

**MIB II.5 – ICMP Group**

IcmpGroup

IcmpInputStatus

IcmpOutputStats

**MIB II.6 – TCP Group**

tcpConnTable

TcpGroup

TcpStats

**MIB II.7 – UDP Group**

udpTable

UdpStats

**MIB II.10 – Transmission Group**

dot3

dot3StatsTable

**MIB II.11 – SNMP Group**

SnmpBasicGroup

SnmpInputStats

SnmpOutputStats

**MIB II.17 – dot1dBridge Group**

dot1dBase

dot1dBasePortTable

dot1dStp

dot1dStpPortTable

dot1dTp

dot1dTpFdbTable

dot1dTpPortTable

dot1dTpHCPortTable

dot1dTpPortOverflowTable

pBridgeMIB

dot1dExtBase

dot1dPriority

dot1dGarp

qBridgeMIB

dot1qBase

dot1qTp

dot1qFdbTable

dot1qTpPortTable

dot1qTpGroupTable

dot1qForwardUnregisteredTable

dot1qStatic

dot1qStaticUnicastTable

dot1qStaticMulticastTable

dot1qVlan

dot1qVlanCurrentTable

dot1qVlanStaticTable

dot1qPortVlanTable

The PT-7828 also provides a private MIB file, located in the file **Moxa-PT7828-MIB.my** on the PT-7828 utility CD-ROM.

**Public Traps**

- Cold Start
- Link Up
- Link Down
- Authentication Failure
- dot1dBridge New Root
- dot1dBridge Topology Changed

**Private Traps**

- Configuration Changed
- Power On
- Power Off
- Traffic Overloaded
- Turbo Ring Topology Changed
- Turbo Ring Coupling Port Changed
- Turbo Ring Master Mismatch

# Specifications

---

**Technology**

## Standards

IEEE 802.3 for 10BaseT,  
IEEE 802.3u for 100BaseT(X) and 100BaseFX,  
IEEE 802.3ab for 1000BaseT(X),  
IEEE 802.3z for 1000BaseSX/LX/LHX/ZX,  
IEEE 802.3x for Flow Control,  
IEEE 802.1D for Spanning Tree Protocol,  
IEEE 802.1w for Rapid STP,  
IEEE 802.1Q for VLAN Tagging,  
IEEE 802.1p for Class of Service,  
IEEE 802.1X for Authentication,  
IEEE 802.3ad for Port Trunk with LACP  
RFC 1058  
RFC 2453

## Flow control

IEEE 802.3x flow control, back pressure flow control

## Protocols:

IGMP V1/V2/V3 device, GMRP, GVRP, SNMP  
V1/V2c/V3, DHCP Server/Client, DHCP Option 82, BootP,  
TFTP, SNTP, SMTP, RARP, RMON, RIP V1/V2.

## MIB:

MIB-II, Ethernet-like MIB, P-BRIDGE MIB, Q-BRIDGE  
MIB, Bridge MIB, RSTP MIB, RMON MIB Group 1, 2, 3,  
9

**Switch Properties**

## Priority Queues:

4

## Max. Number of Available

## VLANs:

64

## VLAN ID Range:

VID 1 to 4094

## IGMP Groups:

256

**Interface**

## Fast Ethernet

Slot 1, 2, 3 for any combination of 8, 7, or 6-port PM-7200  
Fast Ethernet modules with 10/100BaseT(X) or 100BaseFX  
(SC/ST connector)

**Optical Fiber (100BaseFX)**

|                  | 100BaseFX                              |                    |                    |
|------------------|--|--------------------|--------------------|
|                  | Multi Mode                             | Single Mode        | Single Mode, 80 km |
| Wavelength       | 1300 nm                                | 1310 nm            | 1550 nm            |
| Max. TX          | -10 dBm                                | 0 dBm              | 0 dBm              |
| Min. TX          | -20 dBm                                | -5 dBm             | -5 dBm             |
| RX Sensitivity   | -32 dBm                                | -34 dBm            | -34 dBm            |
| Link Budget      | 12 dB                                  | 29 dB              | 29 dB              |
| Typical Distance | 5 km <sup>a</sup><br>4 km <sup>b</sup> | 40 km <sup>c</sup> | 80 km <sup>d</sup> |
| Saturation       | -6 dBm                                 | -3 dBm             | -3 dBm             |

a. 50/125  $\mu\text{m}$ , 800 MHz\*km fiber optic cable

b. 62.5/125  $\mu\text{m}$ , 500 MHz\*km fiber optic cable

c. 9/125  $\mu\text{m}$ , 3.5 PS/(nm\*km) fiber optic cable

d. 9/125  $\mu\text{m}$ , 19 PS/(nm\*km) fiber optic cable

Gigabit Ethernet

Slot 4 for 4 or 2-port PM-7200 Gigabit Ethernet combo module with 10/100/1000BaseT(X) and 1000BaseSX/LX/LHX/ZX (SFP slot, LC connector)

|                  | Gigabit Ethernet                         |   |                    |                    |
|------------------|--|---|--------------------|--------------------|
|                  | SFP-SX                                   | SFP-LX  | SFP-LHX            | SFP-ZX             |
| Wavelength       | 850 nm                                   | 1310 nm   | 1310 nm            | 1310 nm            |
| Max. TX          | -4 dBm                                   | -3 dBm  | 1 dBm              | 5 dBm              |
| Min. TX          | -9.5 dBm                                 | -9.5 dBm  | -4 dBm             | 0 dBm              |
| RX Sensitivity   | -18 dBm                                  | -20 dBm   | -24 dBm            | 24 dBm             |
| Link Budget      | 8.5 dB                                   | 10.5 dB   | 20 dB              | 24 dB              |
| Typical Distance | 550 m <sup>a</sup><br>275 m <sup>b</sup> | 1100 m <sup>c</sup><br>550 m <sup>d</sup><br>10 km <sup>e</sup> | 40 km <sup>e</sup> | 80 km <sup>f</sup> |
| Saturation       | 0 dBm                                    | -3 dBm  | -3 dBm             | -3 dBm             |

a. 50/125  $\mu\text{m}$ , 400 MHz\*km fiber optic cable

b. 62.5/125  $\mu\text{m}$ , 200 MHz\*km fiber optic cable

c. 50/125  $\mu\text{m}$ , 800 MHz\*km fiber optic cable

d. 62.5/125  $\mu\text{m}$ , 500 MHz\*km fiber optic cable

e. 9/125  $\mu\text{m}$ , 3.5 PS/(nm\*km) fiber optic cable

f. 9/125  $\mu\text{m}$ , 19 PS/(nm\*km) fiber optic cable

Console: RS-232 (RJ45)

System LED Indicators: STAT, PWR1, PWR2, FAULT, MASTER, COUPLER

Module LED Indicators: LNK/ACT, FDX/HDX, RING PORT, COUPLER PORT, SPEED

Alarm Contact: One relay output with current carrying capacity of 3A @ 24 VDC or 3A @ 240 VAC

**Power**

Input Voltage 24 VDC (18 to 36 V), or 48 VDC (36 to 72 V), or 125/250 VDC (88 to 300 V) and 110/240 VAC (85 to 264 V)

Input Current (All ports are equipped with fiber)  
Max. 2.58A @ 24VDC,  
Max. 1.21A @ 48VDC,  
Max 0.53A @ 250VDC/240VAC
